The ACM/IEEE International Conference on Internet of Things Design and Implementation (IoTDI) is a premier venue on IoT. In 2018, IoTDI will be held for the third time and topics span the entire ecosystem revolving around IoT, such as cloud and edge computing, data analytics, sensor networks, mobile devices, Internet architecture, middleware and numerous IoT applications. To reflect the interconnection of IoT with both cloud computing and cyber-physical systems, IoTDI is co-located in even years with IEEE IC2E and in odd years with CPS Week.

Plan to submit your best papers to ACM/IEEE IoTDI 2018 (deadline 2017/10/6) and see you in Orlando, Florida, in April 2018, where IoTDI will be co-located with IEEE IC2E.

A confluence of technological advances marks the advent of a new era. World data volume is growing at an unprecedented pace, much of it from embedded devices. Smart cities are expected to grow, fed by millions of data points from multitudes of human and physical sources. Cyber-attacks grow more nefarious, bringing down physical systems. Social networks are becoming ubiquitous, offering information on physical things. The separation between cyber, physical, and social systems is blurring. Collectively, these developments lead to the emergence of a new field, where the networking and physical realms meet. It is the field of the Internet of Things (IoT). This conference is an interdisciplinary forum to discuss challenges, technologies, and emerging directions in system design and implementation that pertain to this Internet of Things. This conference invites researchers and practitioners from academia, industry and government, and accepts original, previously unpublished work on a range of topics related to the Internet of Things.

- Analytic foundations and theory of the Internet of Things
- Reliability, security, timeliness, and robustness in IoT systems
- Novel protocols and network abstractions
- Data streaming architectures
- IoT-motivated cyber-physical and Industrial Internet systems
- Novel quality requirements and their enforcement mechanisms
- Cloud back-ends and resource management for IoT applications
- Personal, wearable, and other embedded networked front-ends
- Social computing and human-in-the-loop issues
- Applications and drivers for the Internet of Things
- Industrial deployment experiences, case studies & lessons learned
- Evaluation and testbeds

Important (Preliminary) Dates

Abstracts due: September 29th, 2017
Full papers due: October 6th, 2017
Author notification: January 15th, 2018

General Chair
Chenyang Lu (Washington University in St. Louis)

Program Co-Chairs
Olaf Landsiedel (Chalmers University of Technology)
Klara Nahrstedt (University of Illinois Urbana-Champaign)

Steering Committee Co-Chairs
Tarek Abdelzaher (Univ. of Illinois Urbana-Champaign)
Hui Lei (IBM Watson Health Cloud)

Finance Chair
Tarek Abdelzaher (Univ. of Illinois Urbana-Champaign)

Publicity Co-Chairs
Simon Duquennoy (Swedish Inst. of Computer Science)
Mo Sha (Binghamton University)
Rui Tan (Nanyang Technological University)

Poster Chair
Abusayeed Saifullah (Wayne State University)

Demo Chair
Carlo Alberto Boano (Graz University of Technology)

Web Chair
Chao Wang (Washington University in St. Louis)

Original work must be submitted that is not published or under submission elsewhere. Manuscripts may not exceed twelve (12) single-spaced double-column pages using 10-point size font on 8.5x11” pages (IEEE conference style), including figures, tables, references, and appendices.
