

An Industry Proof-of Concept Demonstration of Automated Combinatorial Test

Redge Bartholomew

***Rockwell
Collins***

Software Defects Drive Development Cost

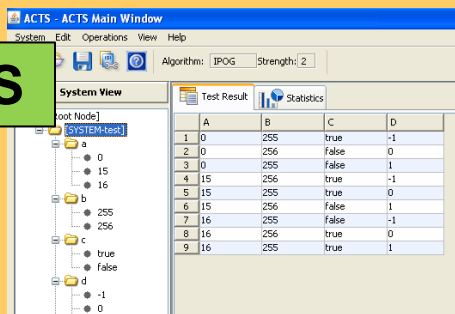

...Especially for safety-critical, embedded systems

- NIST/NASA study looked at 15 years of defects
 - Avionics; medical, space, security systems; servers, browsers
- 6-way combinatorial testing could detect most of them
- NIST/UT-Arlington created a toolset to automate this
- Industry proof-of-concept experiment used them

NIST/UT-Arlington Approach

Tool generates minimum set of input test vectors,

ACTS

... model checker determines expected outputs for each vector,

NuSMV

```

13 State 12,0,255,TRUE,-1,0
14 State 12,16,256,TRUE,-1,272
15 State 13,0,256,TRUE,-1,256
16 State 14,16,255,TRUE,-1,271
17 State 15,0,255,TRUE,-1,255
18 State 16,16,256,FALSE,0,0
19 State 17,0,256,FALSE,0,0
20 State 18,16,255,FALSE,0,0
21 State 19,0,255,FALSE,0,0
22 State 20,16,256,TRUE,0,272
23 State 21,0,256,TRUE,0,256
    
```

User provides test vector generator with input variable definitions & values

... script merges input vectors with their expected outputs,

```

Demonstration Tests a.csv  test_automation_demo_out
1  test #,a,b,c,d,e
2  test 1,0,255,TRUE,-1,255
3  test 2,0,256,FALSE,0,0
4  test 3,0,255,FALSE,1,0
5  test 4,15,256,TRUE,-1,271
6  test 5,15,255,TRUE,0,270
7  test 6,15,256,FALSE,1,15
8  test 7,16,255,FALSE,-1,-16
9  test 8,16,256,TRUE,0,272
10 test 9,16,255,TRUE,1,271
    
```

User provides model of inputs, outputs, properties

... test harness imports, executes, analyzes test cases; identifies failures; measures coverage .

Test Case	Result	Time
TEST1	PASS	11:19:48
TEST2	PASS	11:19:49
TEST3	PASS	11:19:50
TEST4	PASS	11:19:50
TEST5	PASS	11:19:51
TEST6	PASS	11:19:51
TEST7	PASS	11:19:52
TEST8	PASS	11:19:53
TEST9	PASS	11:19:53

Proof-of-Concept Experiment

... reduce the number of defects escaping into system test

- Assess potential cost-effectiveness for unit, integration test
 - Accuracy, coverage, scalability, maturity, ease of learning/using
- Verify parts of a software defined radio (C++, 196 KSLOC)
- Inputs/outputs defined from reverse engineering code

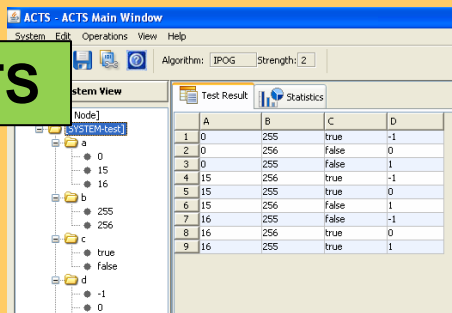

Proof-of-Concept Experiment

... expected output generation deviated from NIST approach

Tool generates minimum set of input test vectors;

User provides test vector generator with input variable definitions & values

ACTS

... model checker generates the state space;

... utility finds states containing input vectors, exports them as test cases;

... test harness imports, executes, analyzes test cases; identifies failures; measures coverage.

NuSMV

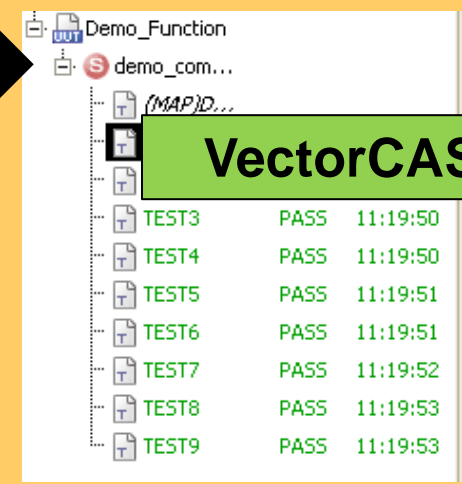

```

13 State 11,0,255,TRUE,-1,0
14 State 12,16,256,TRUE,-1,272
15 State 13,0,256,TRUE,-1,256
16 State 14,16,255,TRUE,-1,271
17 State 15,0,255,TRUE,-1,255
18 State 16,16,256,FALSE,0,0
19 State 17,0,256,FALSE,0,0
20 State 18,16,255,FALSE,0,0
21 State 19,0,255,FALSE,0,0
22 State 20,16,256,TRUE,0,272
23 State 21,0,256,TRUE,0,256
    
```

```

demonstration Tests a.csv  test_automation_demo_out
1 test #,a,b,c,d,e
2 test 1,0,255,TRUE,-1,255
3 test 2,0,256,FALSE,0,0
4 test 3,0,255,FALSE,1,0
5 test 4,15,256,TRUE,-1,271
6 test 5,15,255,TRUE,0,270
7 test 6,15,256,FALSE,1,15
8 test 7,16,255,FALSE,-1,-16
9 test 8,16,256,TRUE,0,272
10 test 9,16,255,TRUE,1,271
    
```

VectorCAST

User provides model of inputs, outputs, properties

Defining the Input Space

... minimizing the vector set

The screenshot displays a software interface for defining an input space. On the left, a hierarchical tree structure shows the following variables and their values:

- [Root Node]
 - SYSTEM-RCTG
 - a
 - 0
 - 15
 - 16
 - b
 - 255
 - 256
 - c
 - true
 - false
 - d
 - 1
 - 0
 - 1
 - Relations

On the right, a table shows the resulting test vectors:

	A	B	C	D
1	0	256	false	-1
2	0	255	true	0
3	0	256	true	1
4	15	255	true	-1
5	15	256	false	0
6	15	255	false	1
7	16	256	true	-1
8	16	255	false	0
9	16	256	true	1

For variables a, b, c, d, ACTS condenses all 37 2-way combinations of input values into 9 test vectors.

Generating Expected Outputs

```
MODULE main
```

```
VAR
```

```
  a : {0,15,16};
```

```
  b : {255,256};
```

```
  c : {true,false};
```

```
  d : {-1,0,1};
```

```
DEFINE
```

```
  e :=
```

```
  case ... when c = true, e = a + b,
```

```
        (c = true) : a + b;
```

```
        TRUE : a * d;
```

```
  esac; ... otherwise, e = a * d
```

Developer models
input-output
relationships,

... the model checker
generates the state space

```
d = -1
```

```
----- State 30 -----
```

```
e = -15
```

```
a = 15
```

```
b = 255
```

```
c = false
```

```
d = -1
```

```
----- State 31 -----
```

```
e = 271
```

```
a = 15
```

```
b = 256
```

```
c = true
```

```
d = -1
```

Defining the Input Space

... to maximize defect detection & structural coverage

- More input values = better defect detection & coverage
 - ... and greater risk of combinatorial explosion
- Equivalence classes can reduce the number of values
- Interaction testing can reduce the number of variables
 - Test only those that interact; others set to default values

Verifying the Expected Outputs

... debugging the model – e.g., coding & requirements errors

- 50 test vectors arbitrarily selected for manual verification.
- Model checker compared output model vs. properties
 - After gaining familiarity with tool, language, notation
- False positive/negative detection of seeded defects
 - Initially, most traced back to bugs in the expected output model

Accuracy & Scalability – Unit Test

... number of Input variables & values

- Radio control loop for normal mode: 11 inputs, 15 outputs
- Seeded 100+ errors in code across several versions
- Required interaction testing (avoid combinatorial explosion)
- 47,040 tests generated, executed, analyzed in ~2.6 hrs.
 - All defects detected; 98% branch coverage (~2 hrs.)

Accuracy & Scalability – Unit Test

... complex logic

- Mode control: 34 inputs, 4 outputs of interest
 - 39 if-tests nested up to 8-levels deep, embedded in a 6-case switch
 - 200+ seeded defects
- Used several sets of interaction tests (largest = 19 inputs)
- 2775 tests generated, executed, analyzed in ~1hour
 - All defects detected; 95% MC/DC required ~16 hours

Modified Condition/Decision Coverage

- Independence of outcome required writing test stubs
 - ... to force the sequence of input vectors in multi-conditionals
 - ... e.g., in loops that modify the control variable

MC/DC: Every condition in a decision

- ... has taken all possible outcomes at least once,
- ... and each condition independently affected the outcome

```
while ((current_radio_state != APPLICATIONS_RUNNING) &&  
(current_radio_state != NO_WAVEFORM_AVAILABLE))  
{  
    current_radio_state = Radio_State();  
}
```

Radio_State stub must return specific, successive values

Accuracy & Scalability - Integration Test

- Tested code unit via 6 levels of nested procedure calls
 - Intervening variables set to force execution along required path
- 30,905 tests detected seeded defects
 - Finding intervening variables (30+) & default values: several days
- Scalability for large/nested architecture requires mitigation

Ease of Learning & Using – 1st Test

... 1st test (complex logic): ~84 hrs. total vs. 80 hr. target

- Staff had no prior experience with tools or code
- Learning ACTS (~2 hrs.) + defining 34 inputs (~4 hrs.)
- Learning NuSMV (~20 hrs.) + Debugging model (~12 hrs.)
- Structural coverage: branch (~2 hrs.)
 - MC/DC: another 16 hrs. (includes defining/constructing stubs)

Maturity

... adapted from DoD/NASA Technology Readiness Calculator*

- Level 7
 - Prototype software exists & all key functionality is available for demonstration/test
 - It is well integrated with operational systems
 - Operational feasibility has been demonstrated
 - Most software bugs have been eliminated
 - Some documentation is available

Technology Readiness Levels

1. Basic principles observed
2. Concept/application formulated
3. Experimental proof-of-concept
4. Validation in laboratory
5. Validation in a relevant environment
6. Prototype demonstration
7. **Prototype demonstrated in [operational environment]**
8. [Operationally] qualified via test
9. Proven via mission operations

Summary

... effective enough for unit test

- Significant defect detection, coverage from moderate effort
- May play a role in integration test
- Finding equivalence class values requires experience
 - So does using model checker properties to find expected outputs
- Deployment issues: support, packaging, licensing, training

Acronyms

- ACTS – Advanced Combinatorial Testing System
- DoD – Department of Defense
- GAO – Government Accountability Office
- KSLOC – 1000's of Source Lines of Code
- MC/DC – Modified Condition/Decision Coverage
- NASA – National Aeronautics and Space Administration
- NIST – National Institute of Standards and Technology
- UT-Arlington – University of Texas at Arlington
