

EMMA

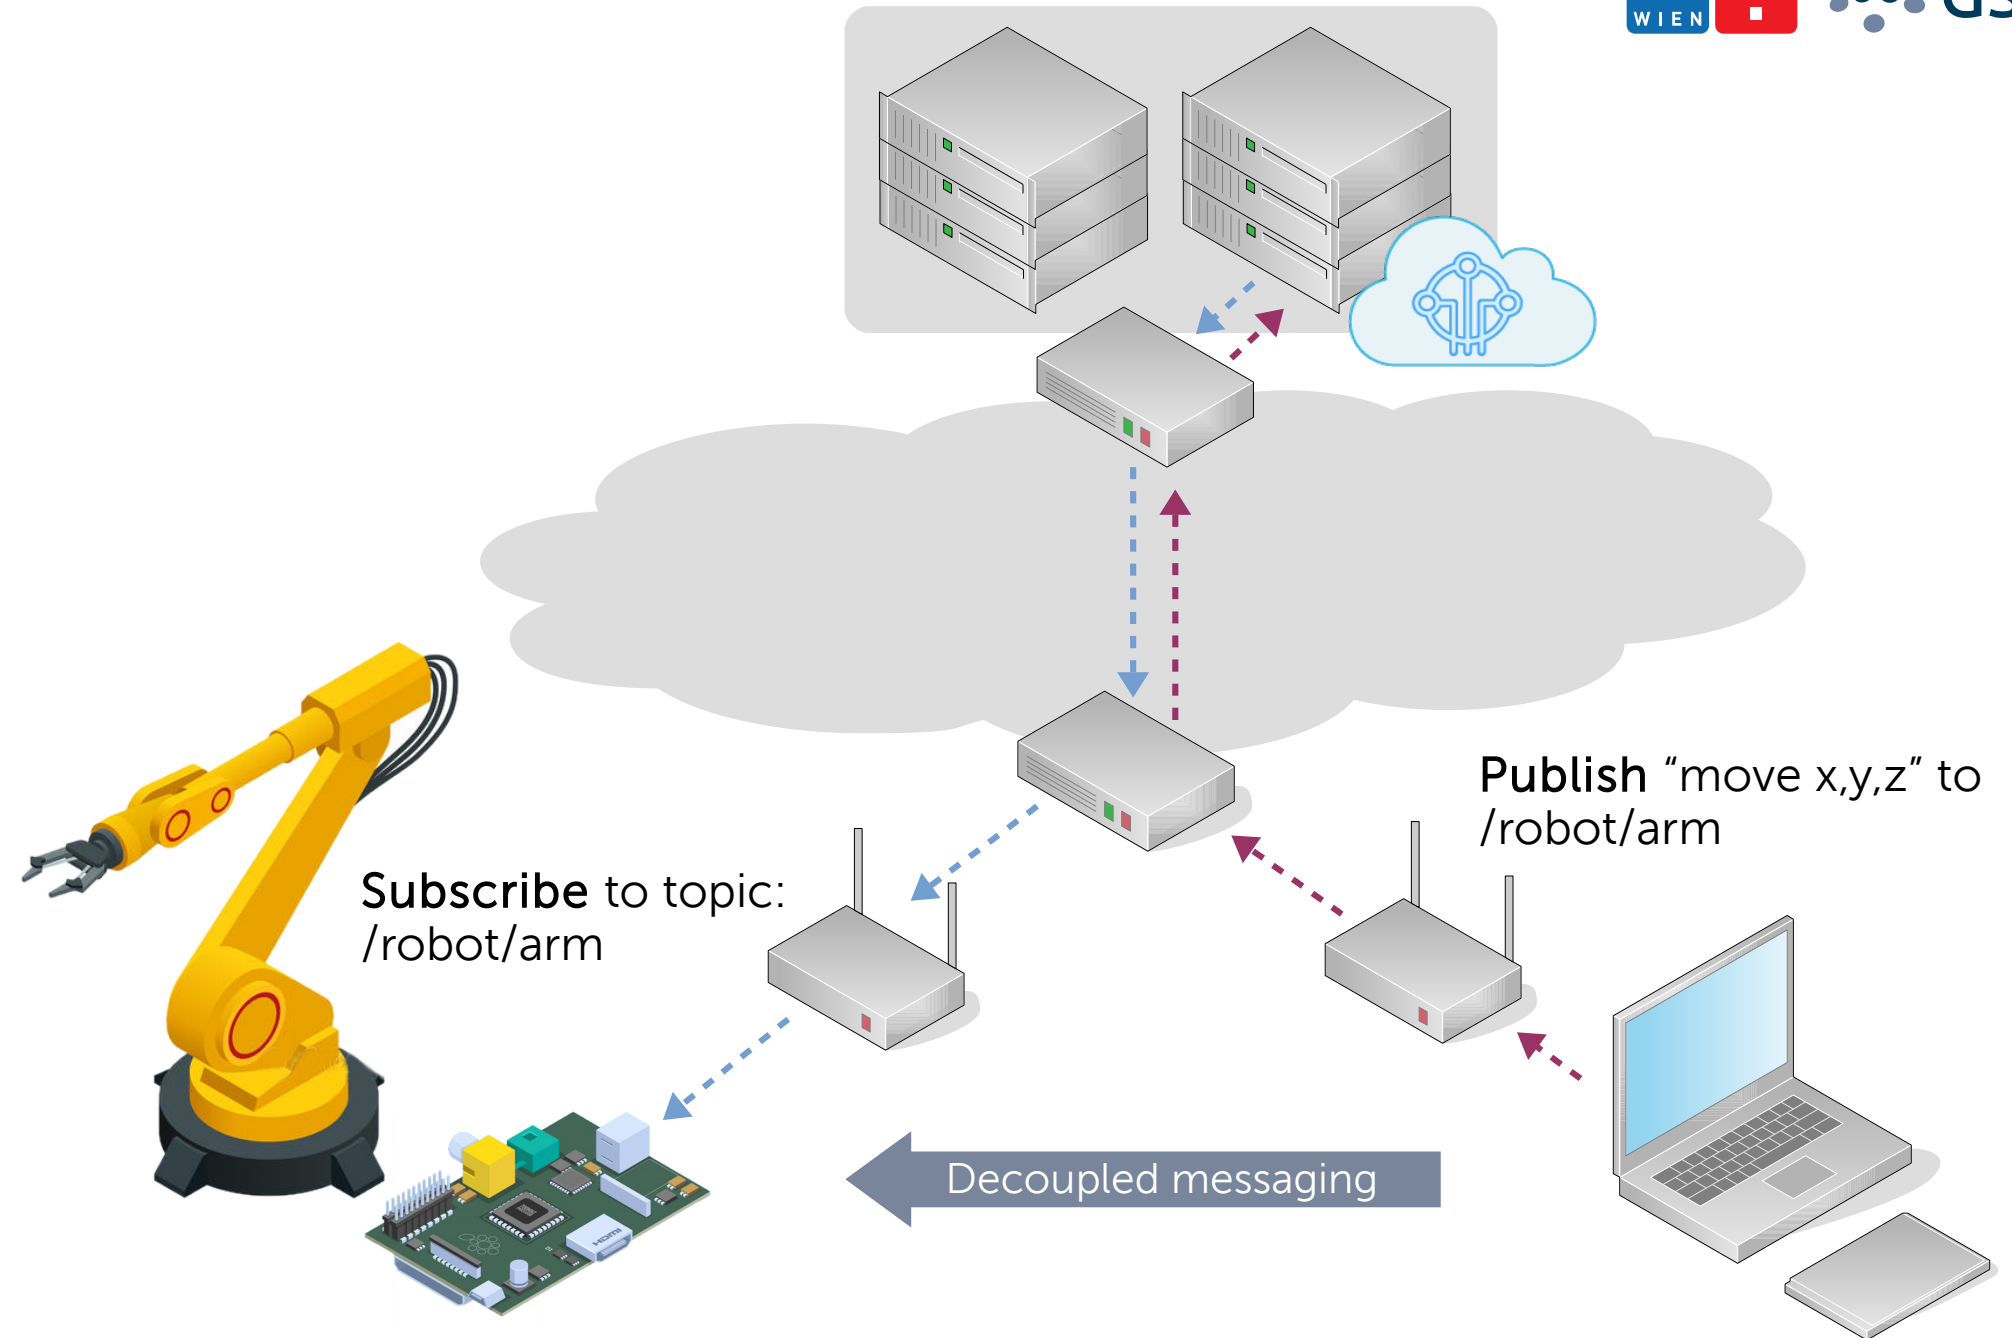

Distributed QoS-Aware MQTT Middleware for Edge Computing Applications

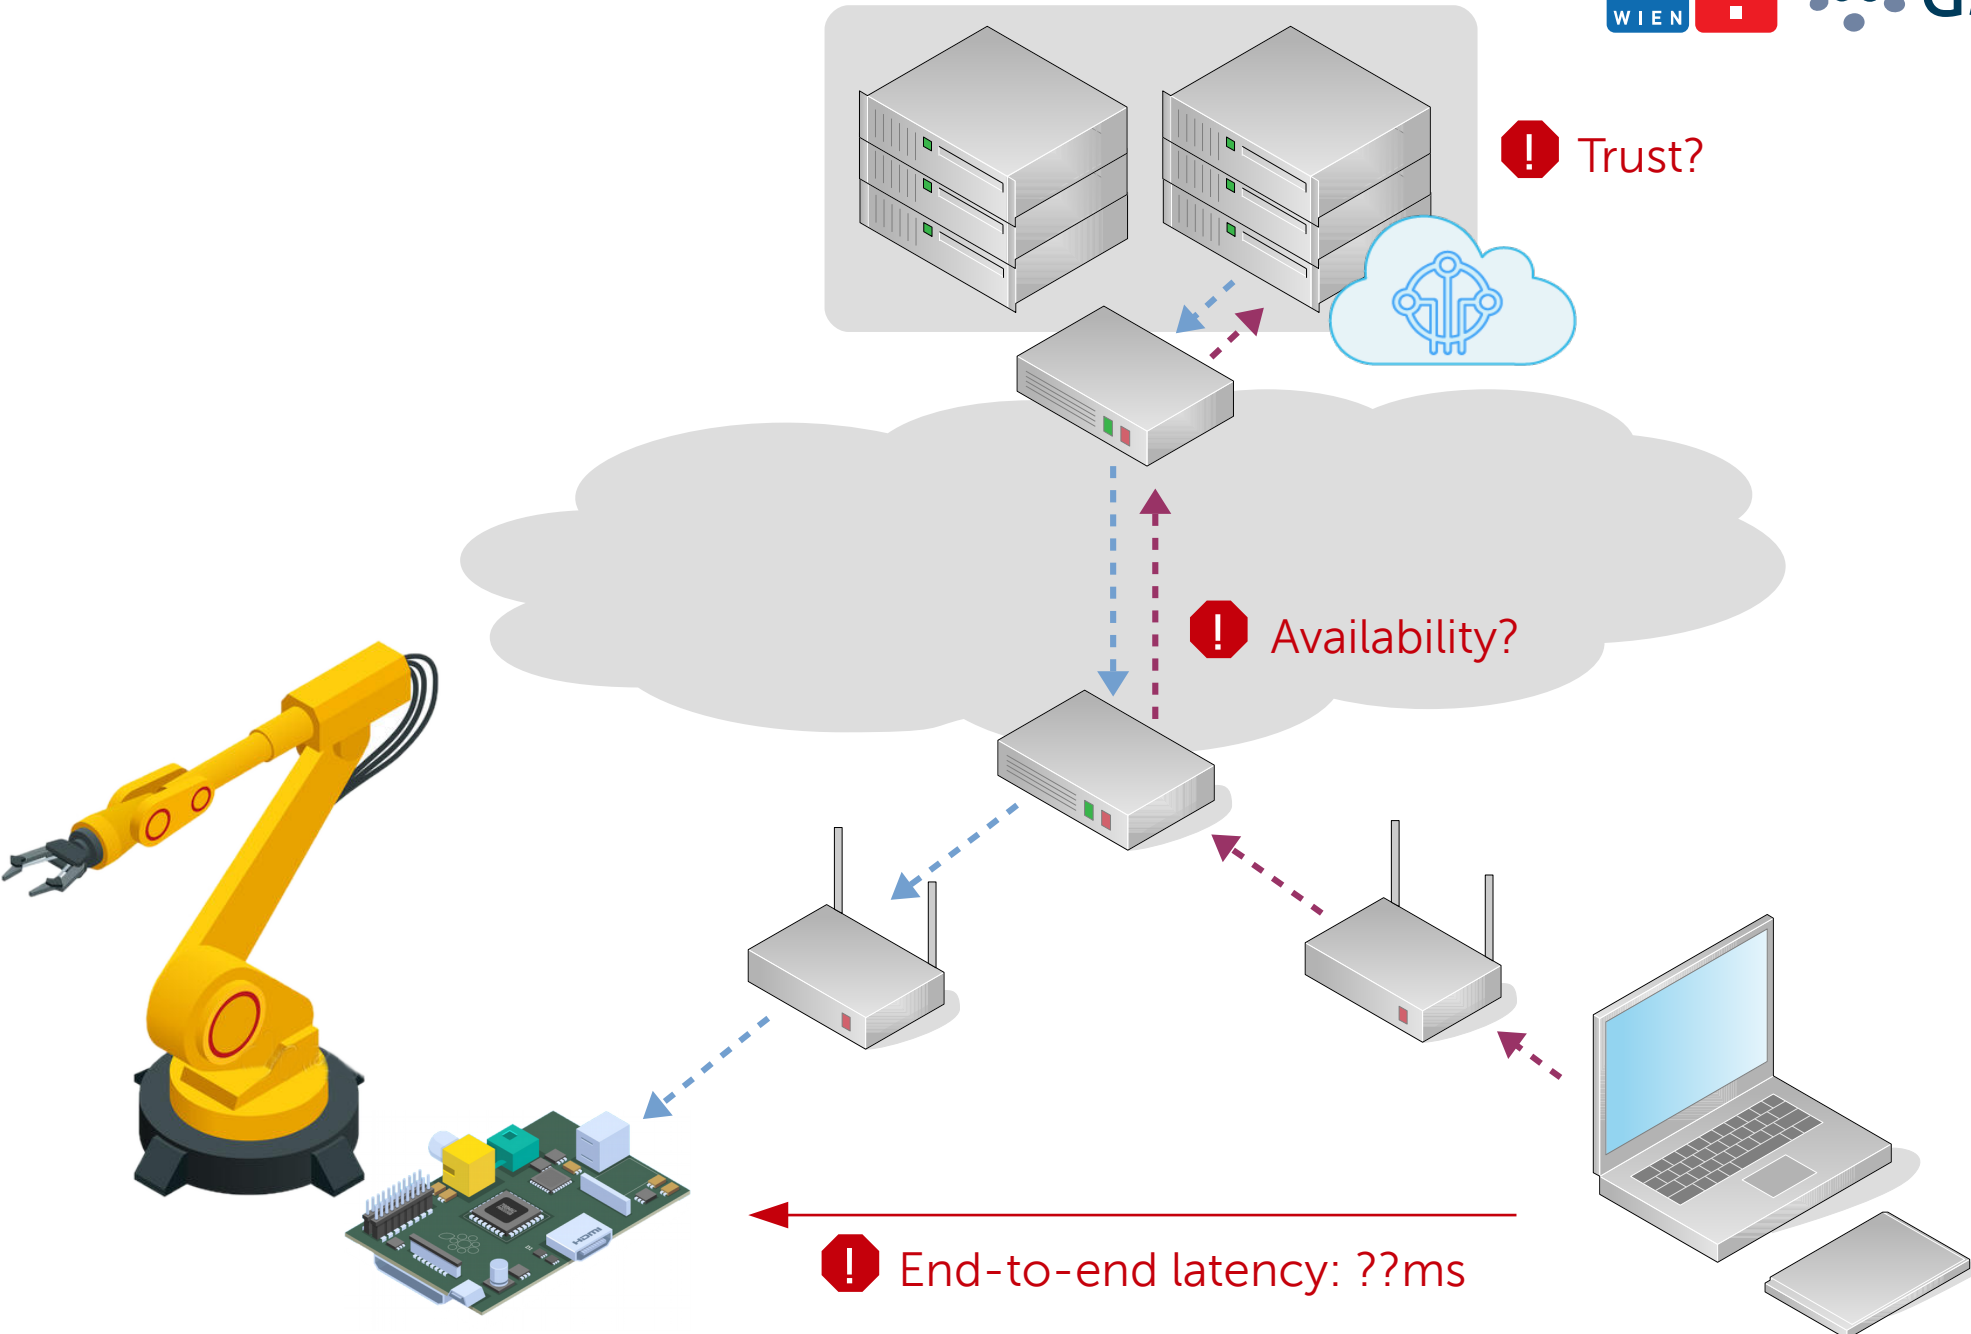

Thomas Rausch, Stefan Nastic, Schahram Dustdar

TU Wien
Distributed Systems Group
<http://dsg.tuwien.ac.at>

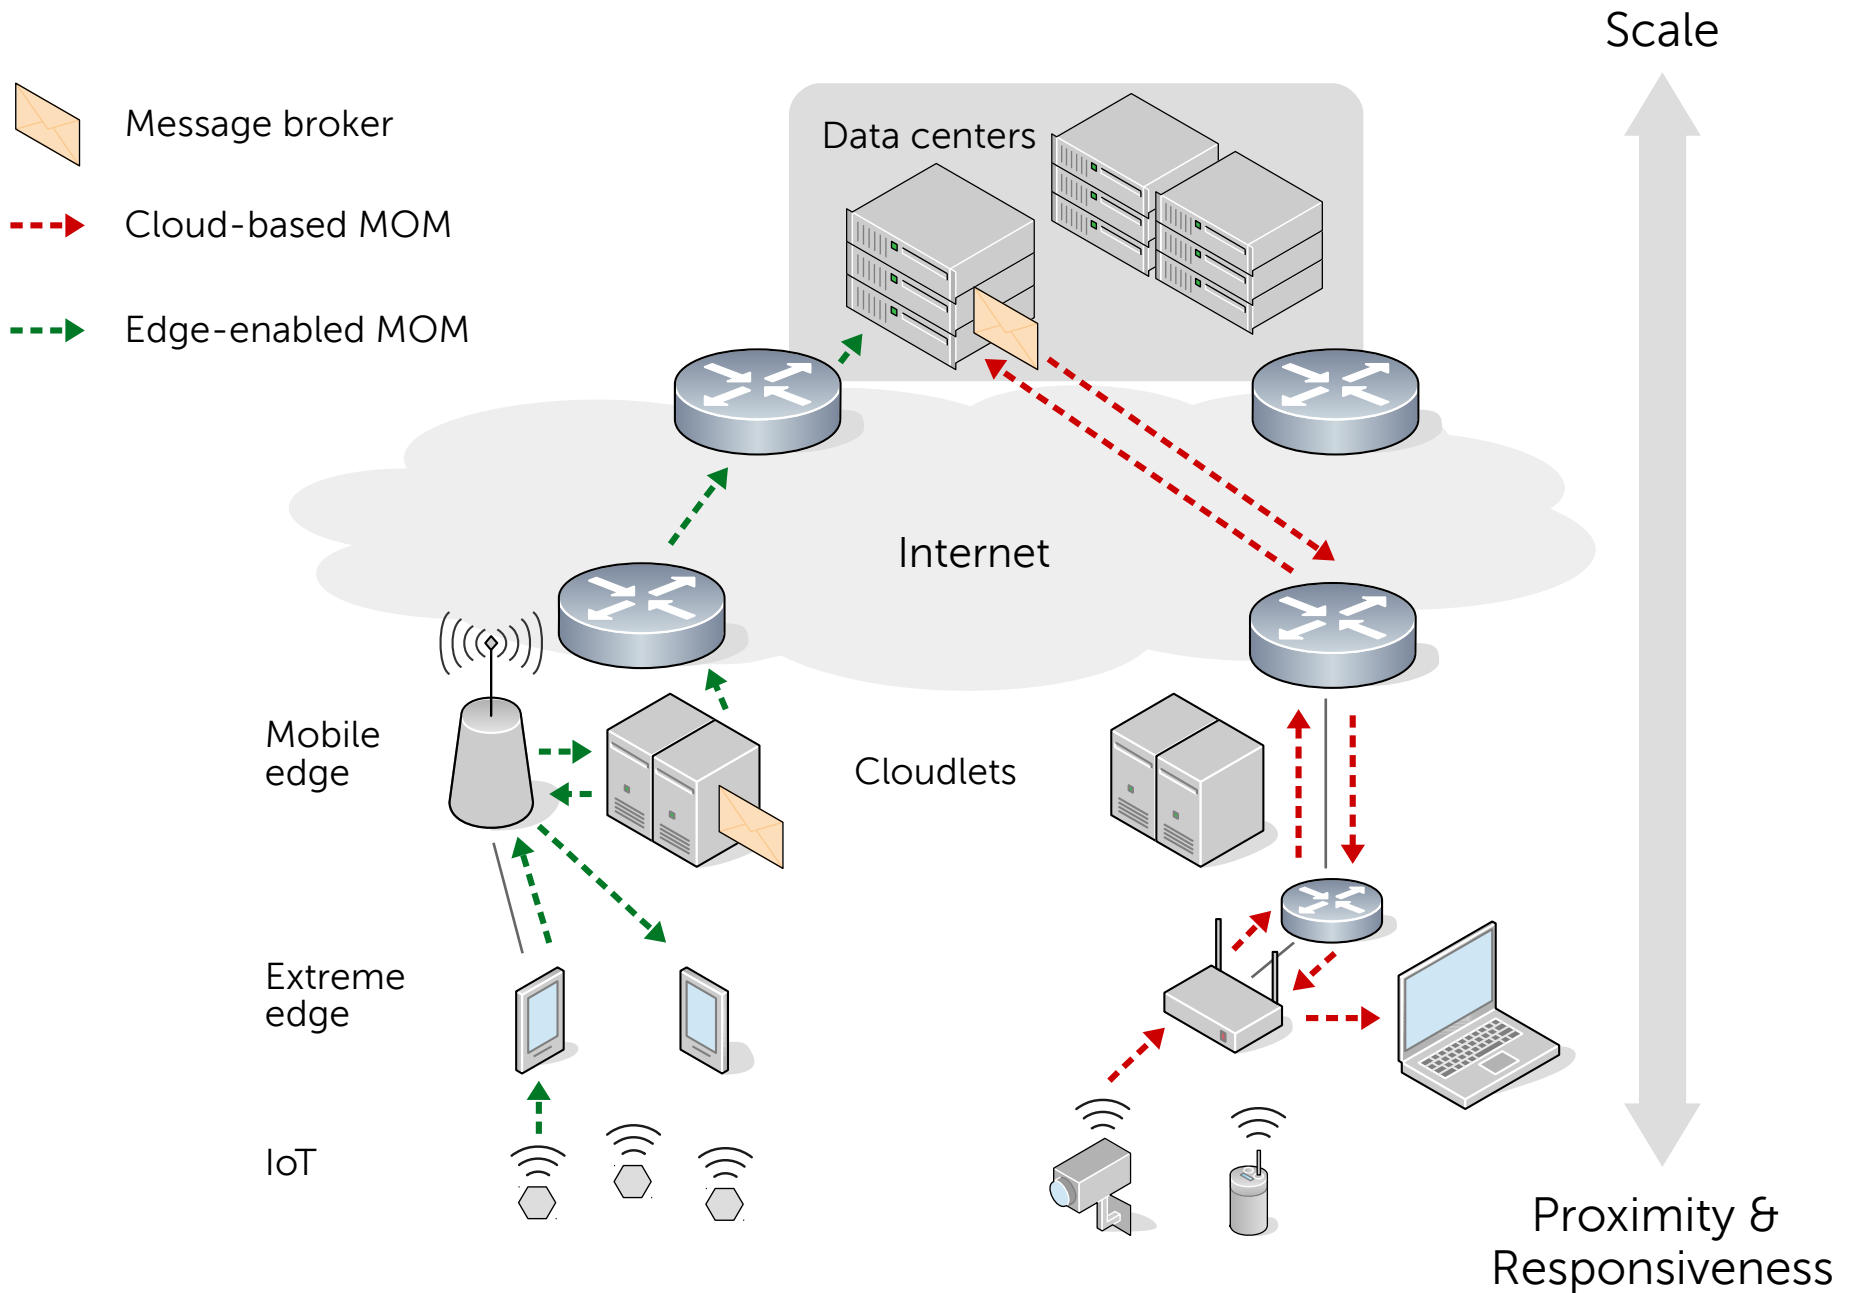

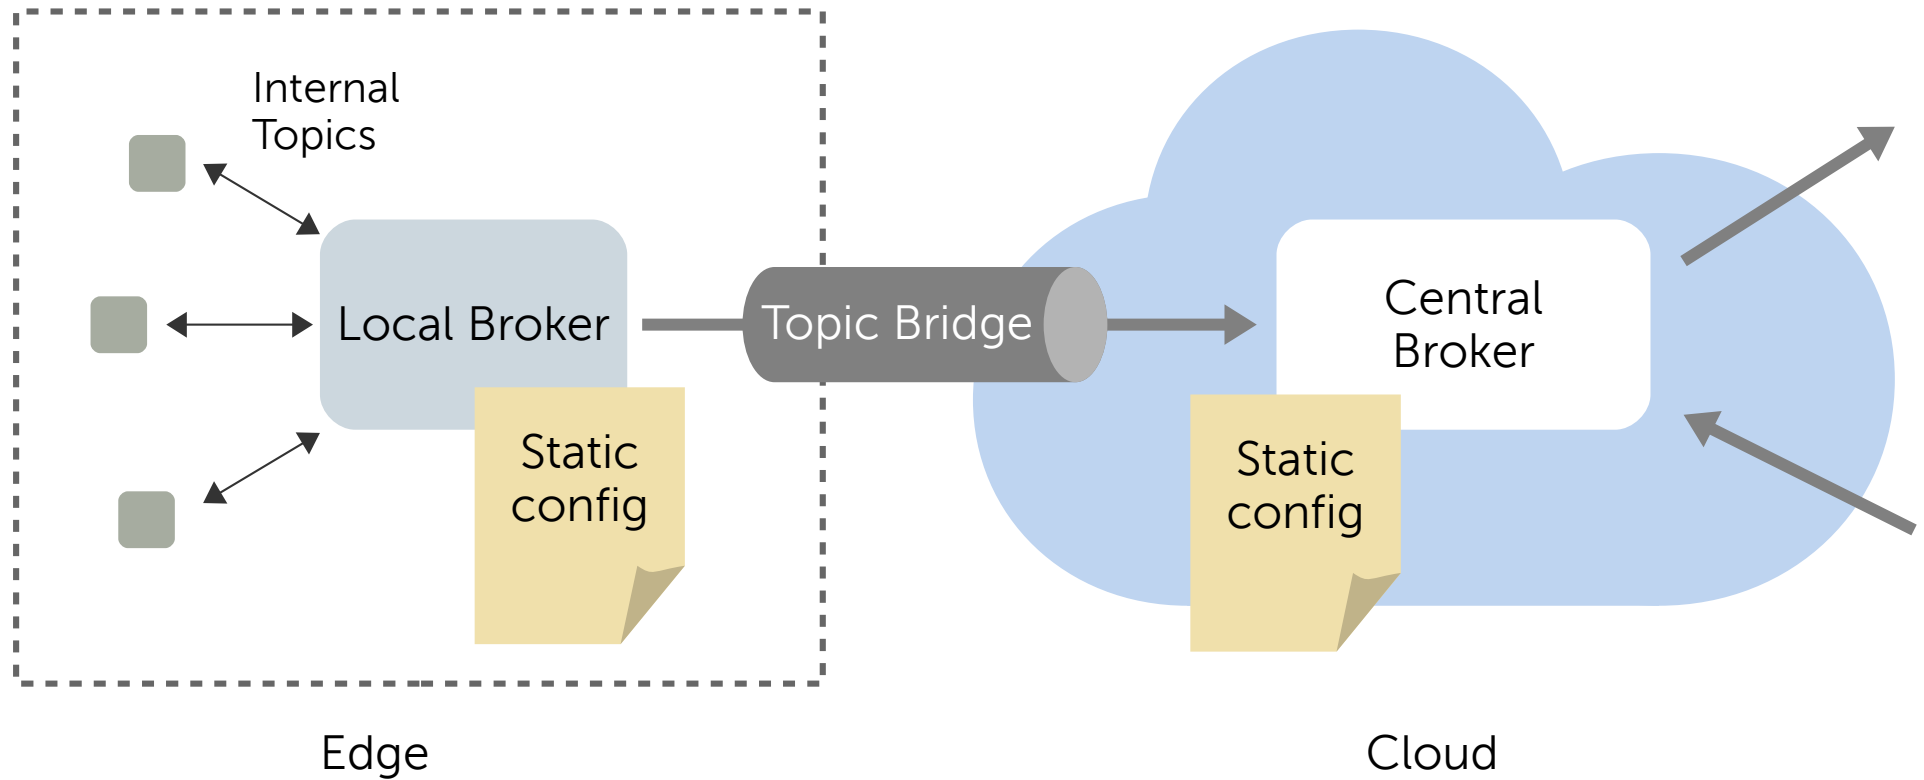

Edge-Enabled MOM

- Popular platform for IoT
 - ISO standardized pub/sub protocol
 - Low-bandwidth design
- Simple Protocol
 - CONNACK
 - SUBSCRIBE(t), SUBACK(t)
 - PUBLISH(t, msg)
 - ...

Static MQTT Topic Bridging

M. Garcia, "How to Bridge Mosquitto MQTT Broker to AWS IoT"

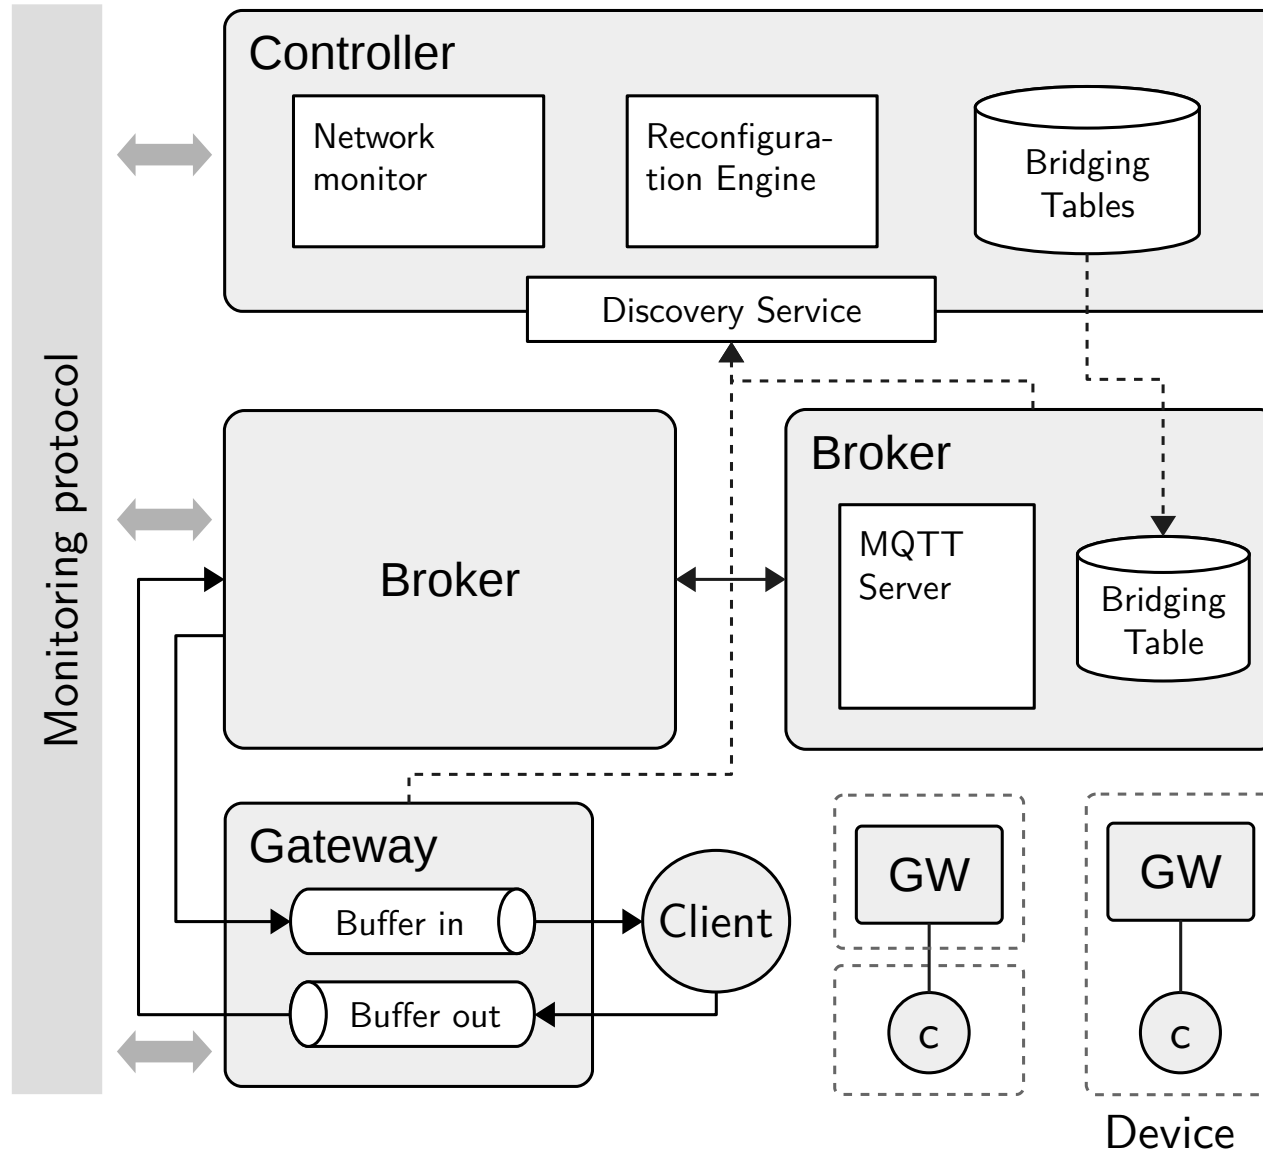

The Internet of Things on AWS -- Official Blog, 2016.

<https://aws.amazon.com/blogs/iot/how-to-bridge-mosquitto-mqtt-broker-to-aws-iot/>

- Decentralized messaging middleware
- Leverages edge resources to reduce latency
- Can handle mobile clients
- Can handle volatile resources
- Seamlessly integrates with IoT infrastructure

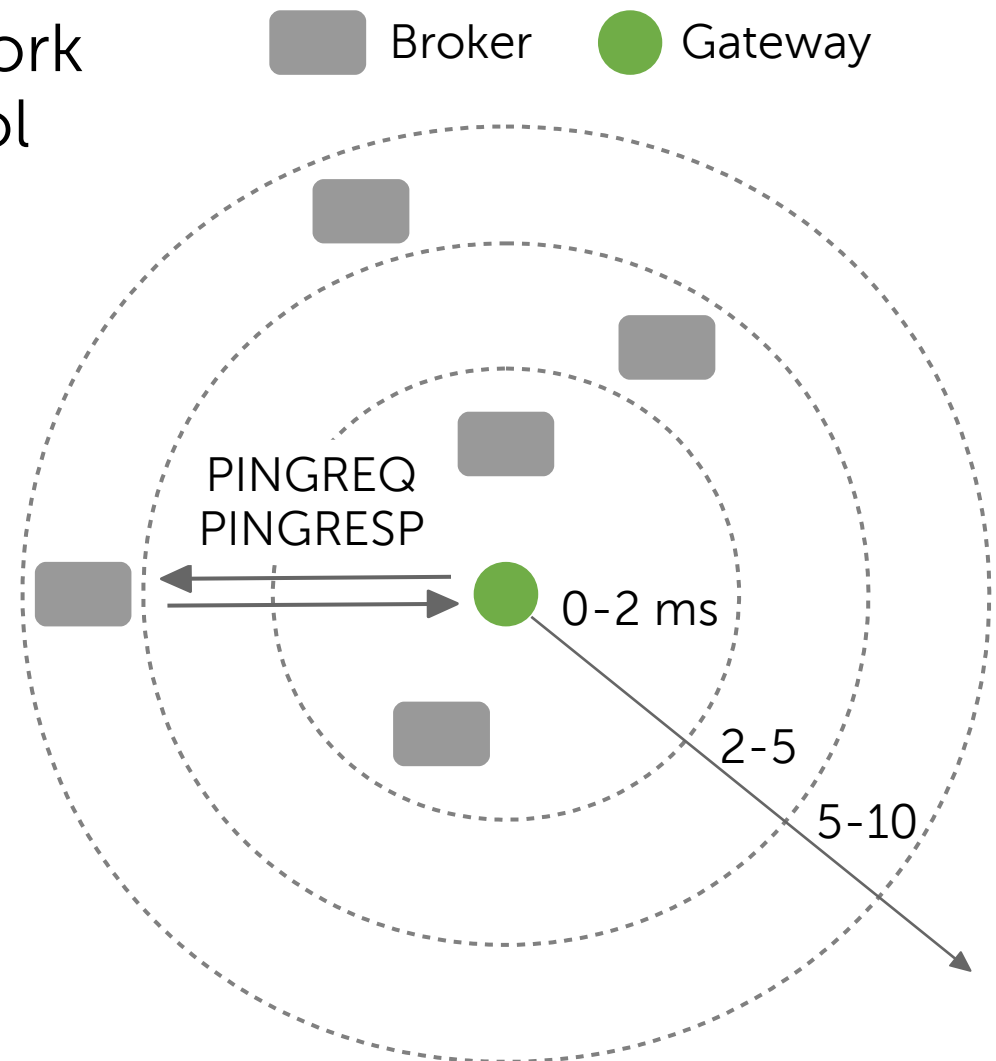

EMMA MQTT Middleware

<https://git.dsg.tuwien.ac.at/emma/emma>

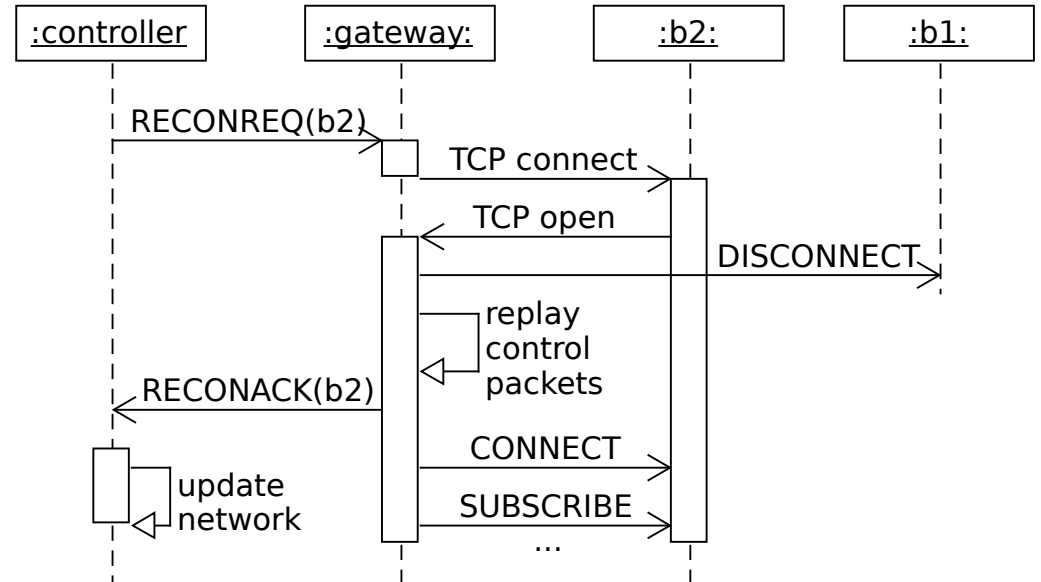

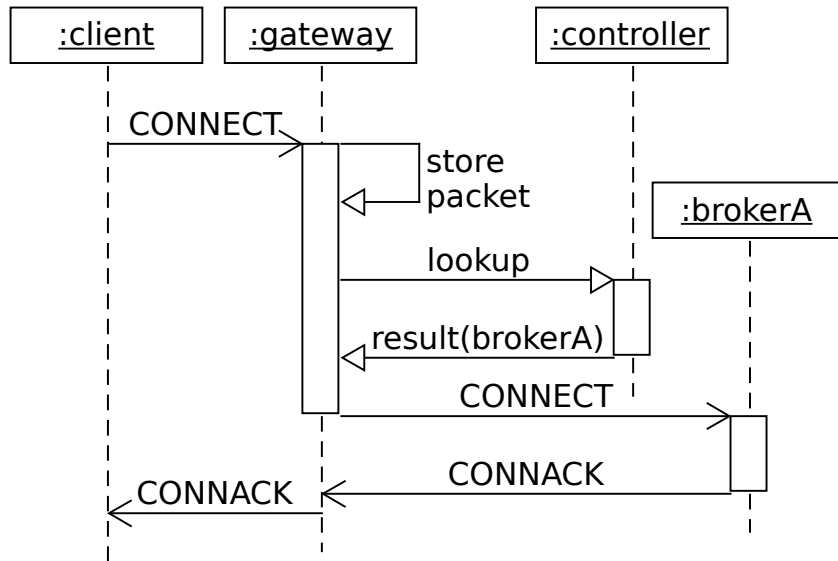

QoS Optimization & Balancing

- Continuously monitor network QoS via simple UDP protocol
- For each client create latency group to brokers
- Connect gateways to a broker in closest group
- Balance load between brokers in same group

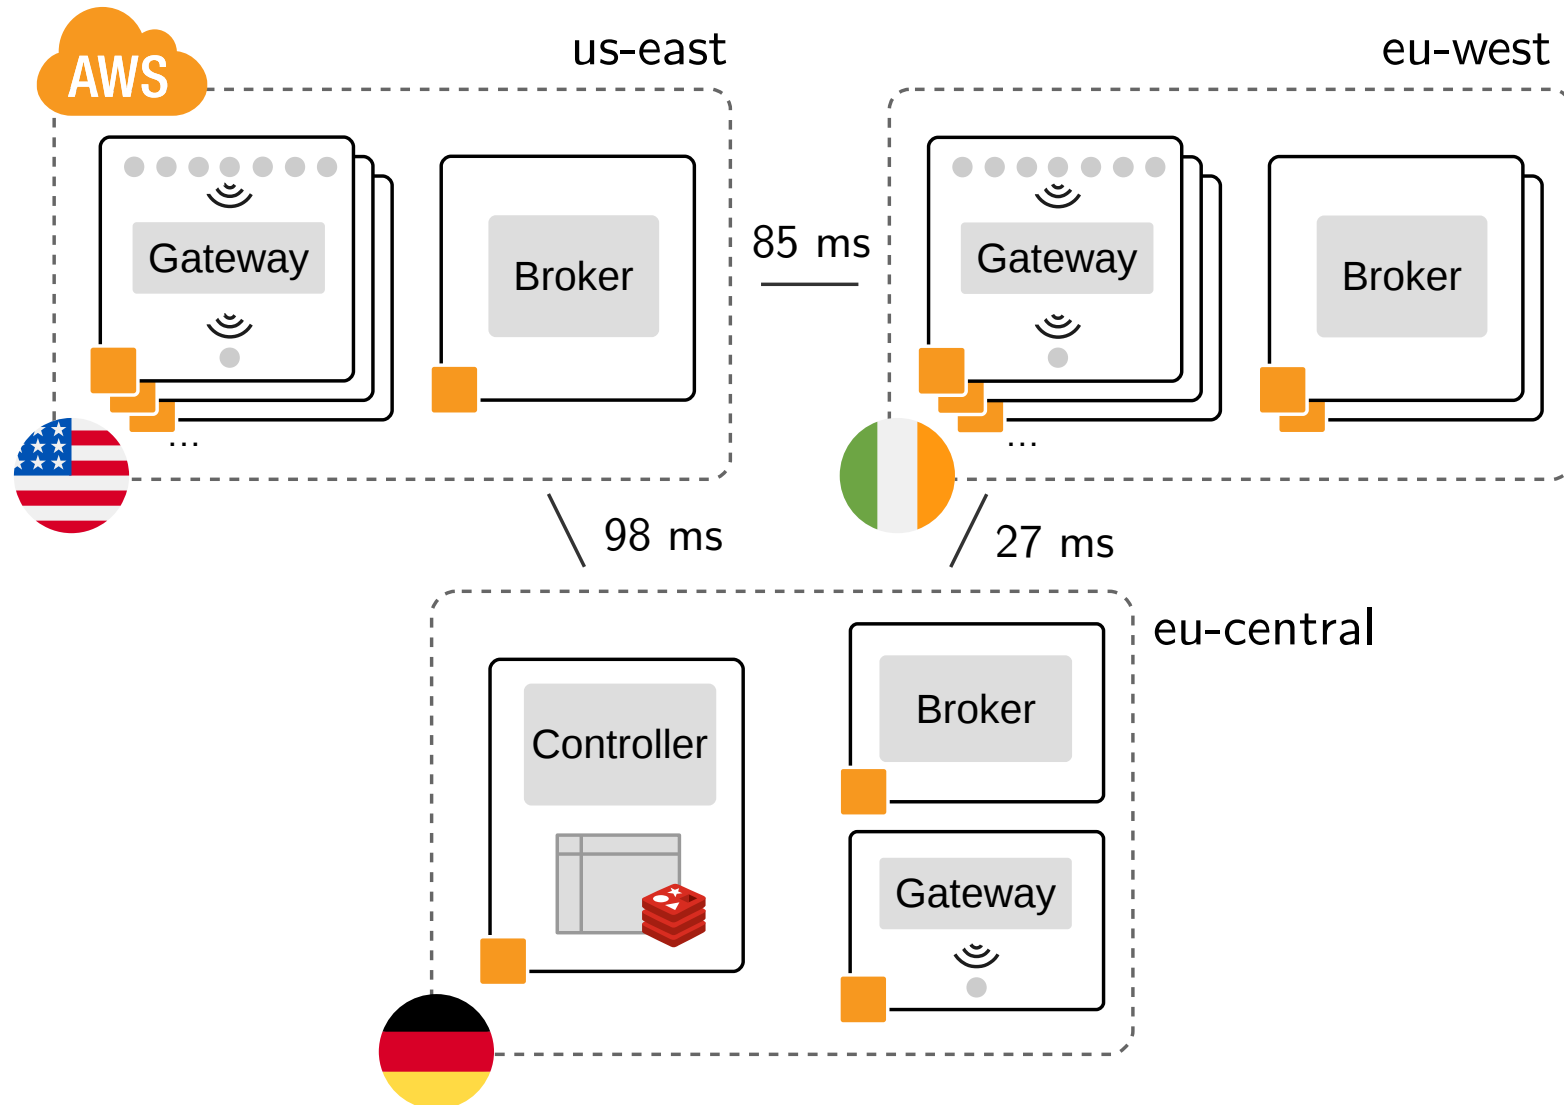

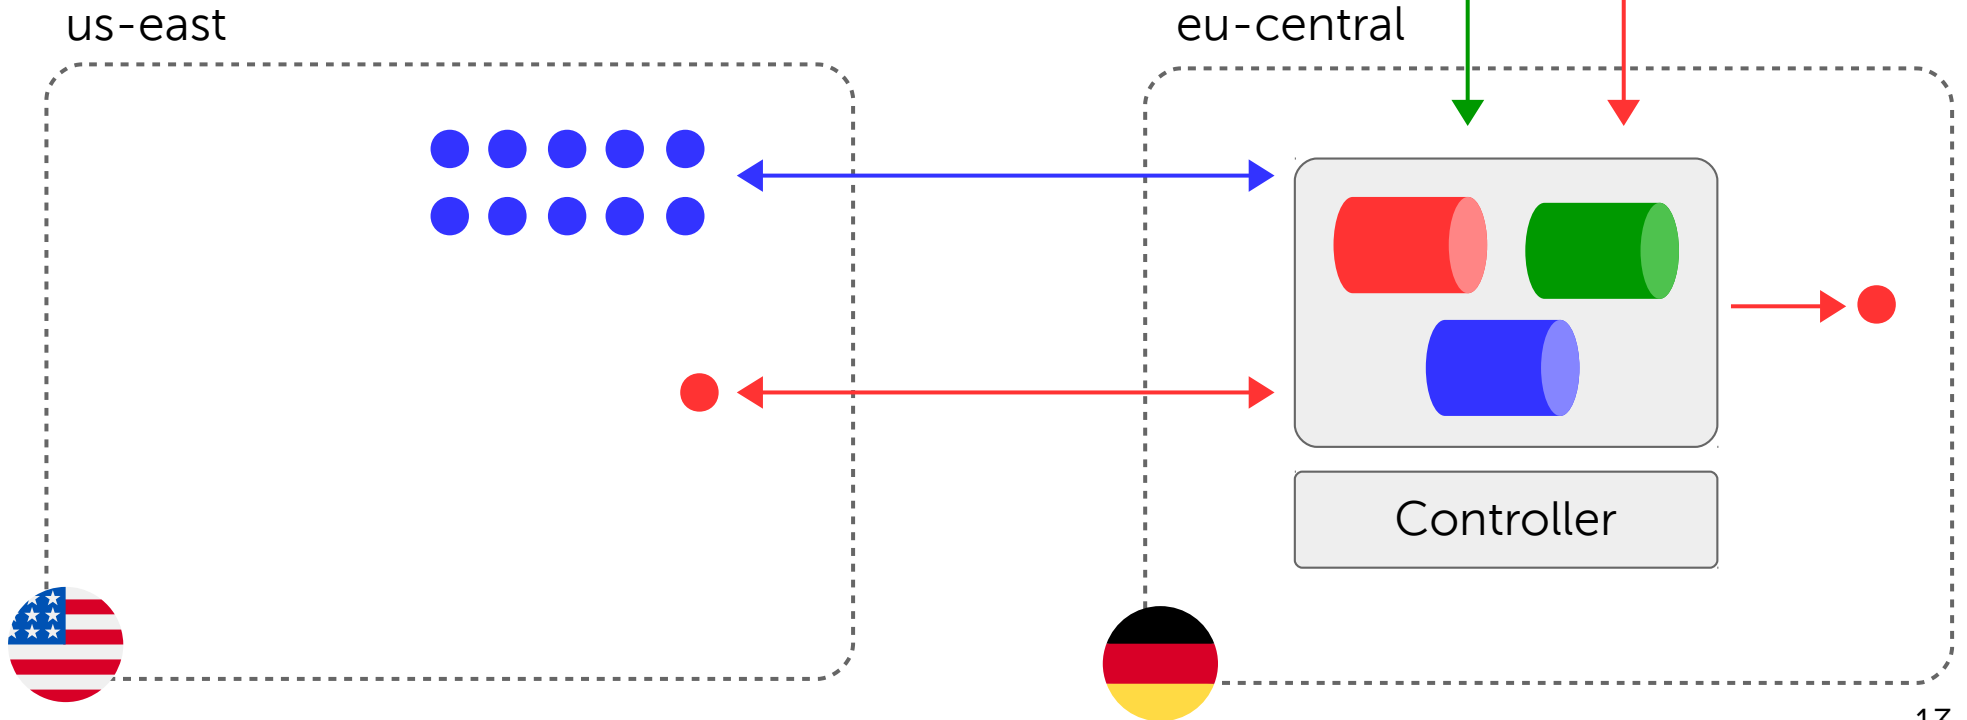

Orchestration

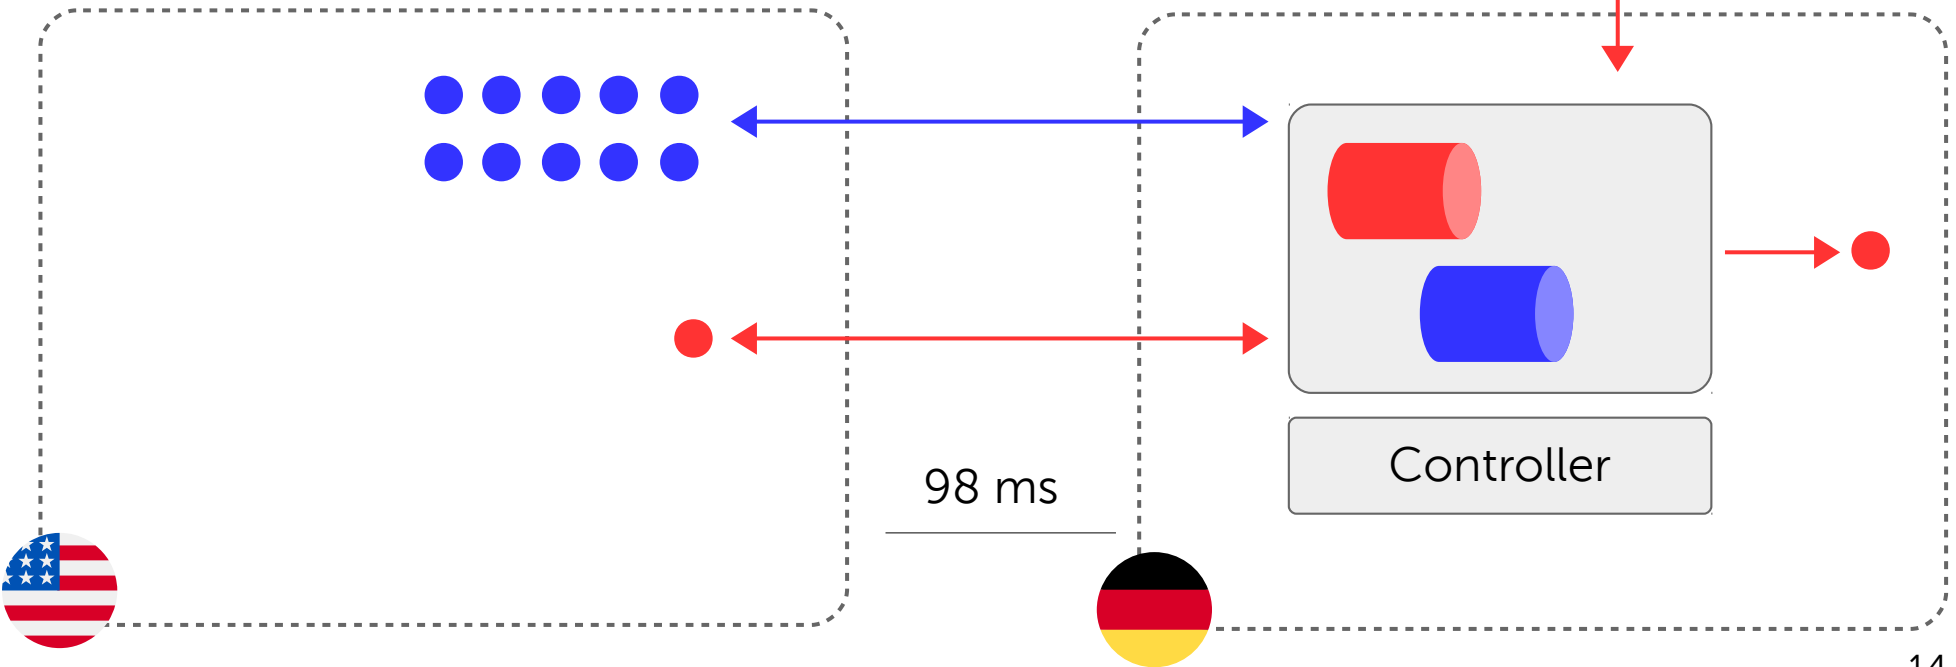

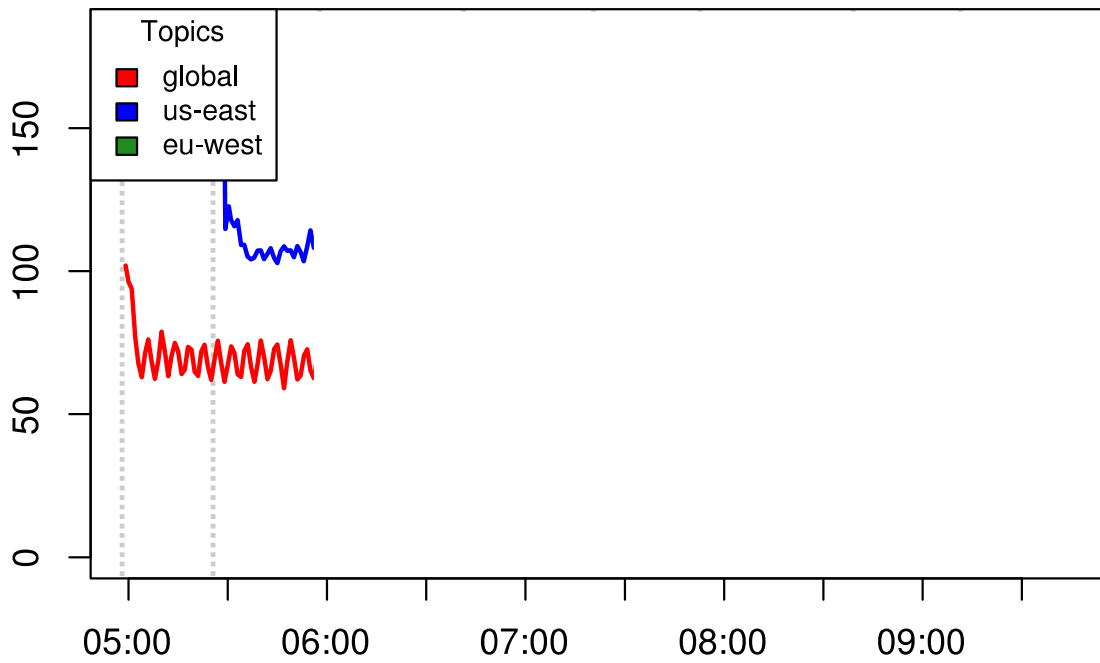

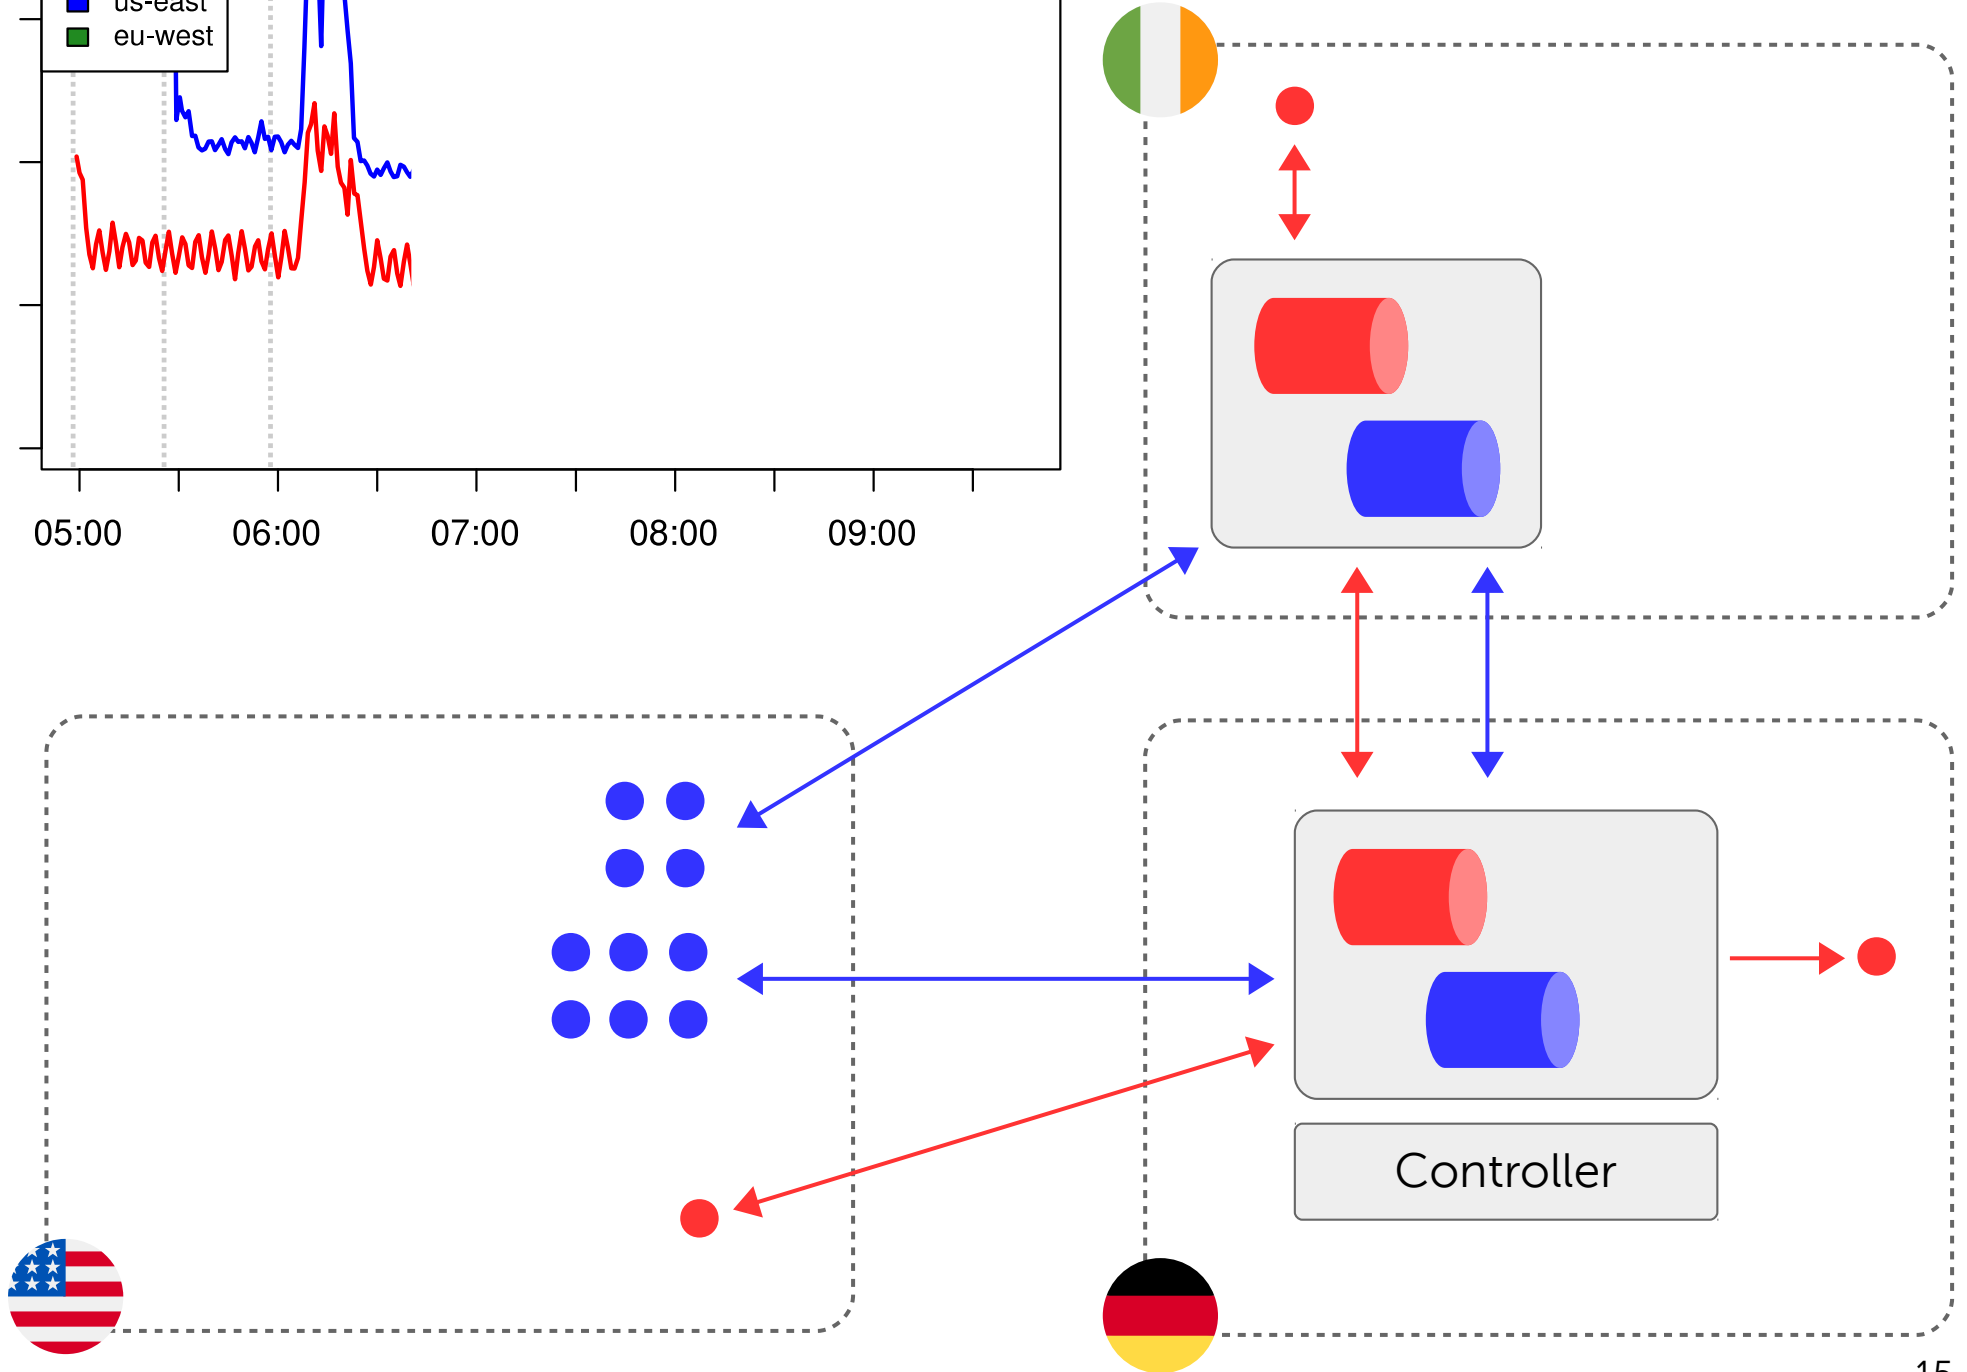

Evaluation

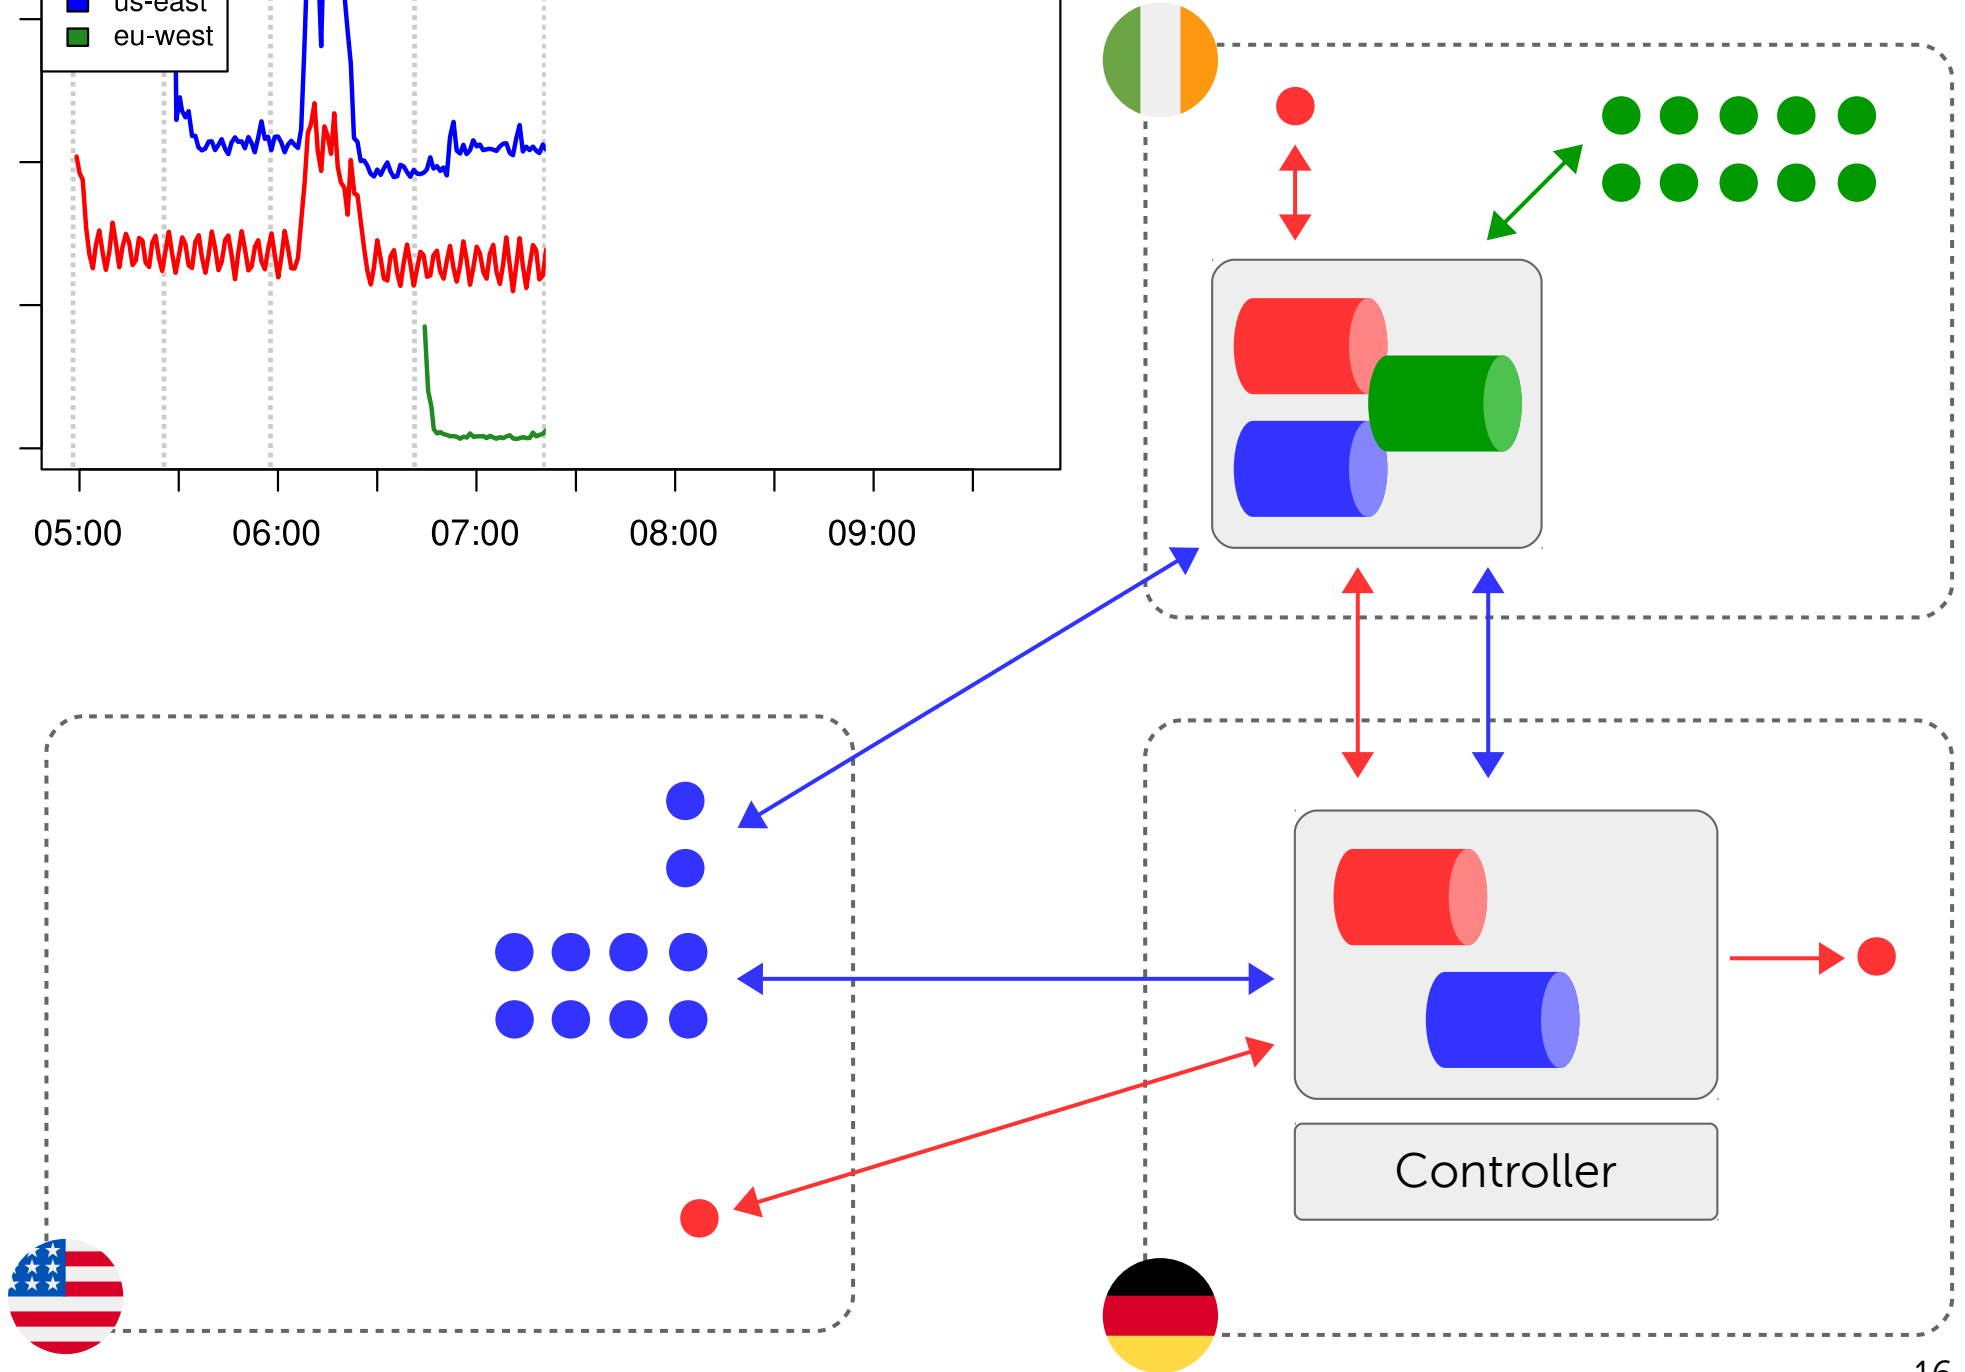

<https://git.dsg.tuwien.ac.at/emma/pubsub-benchmark>

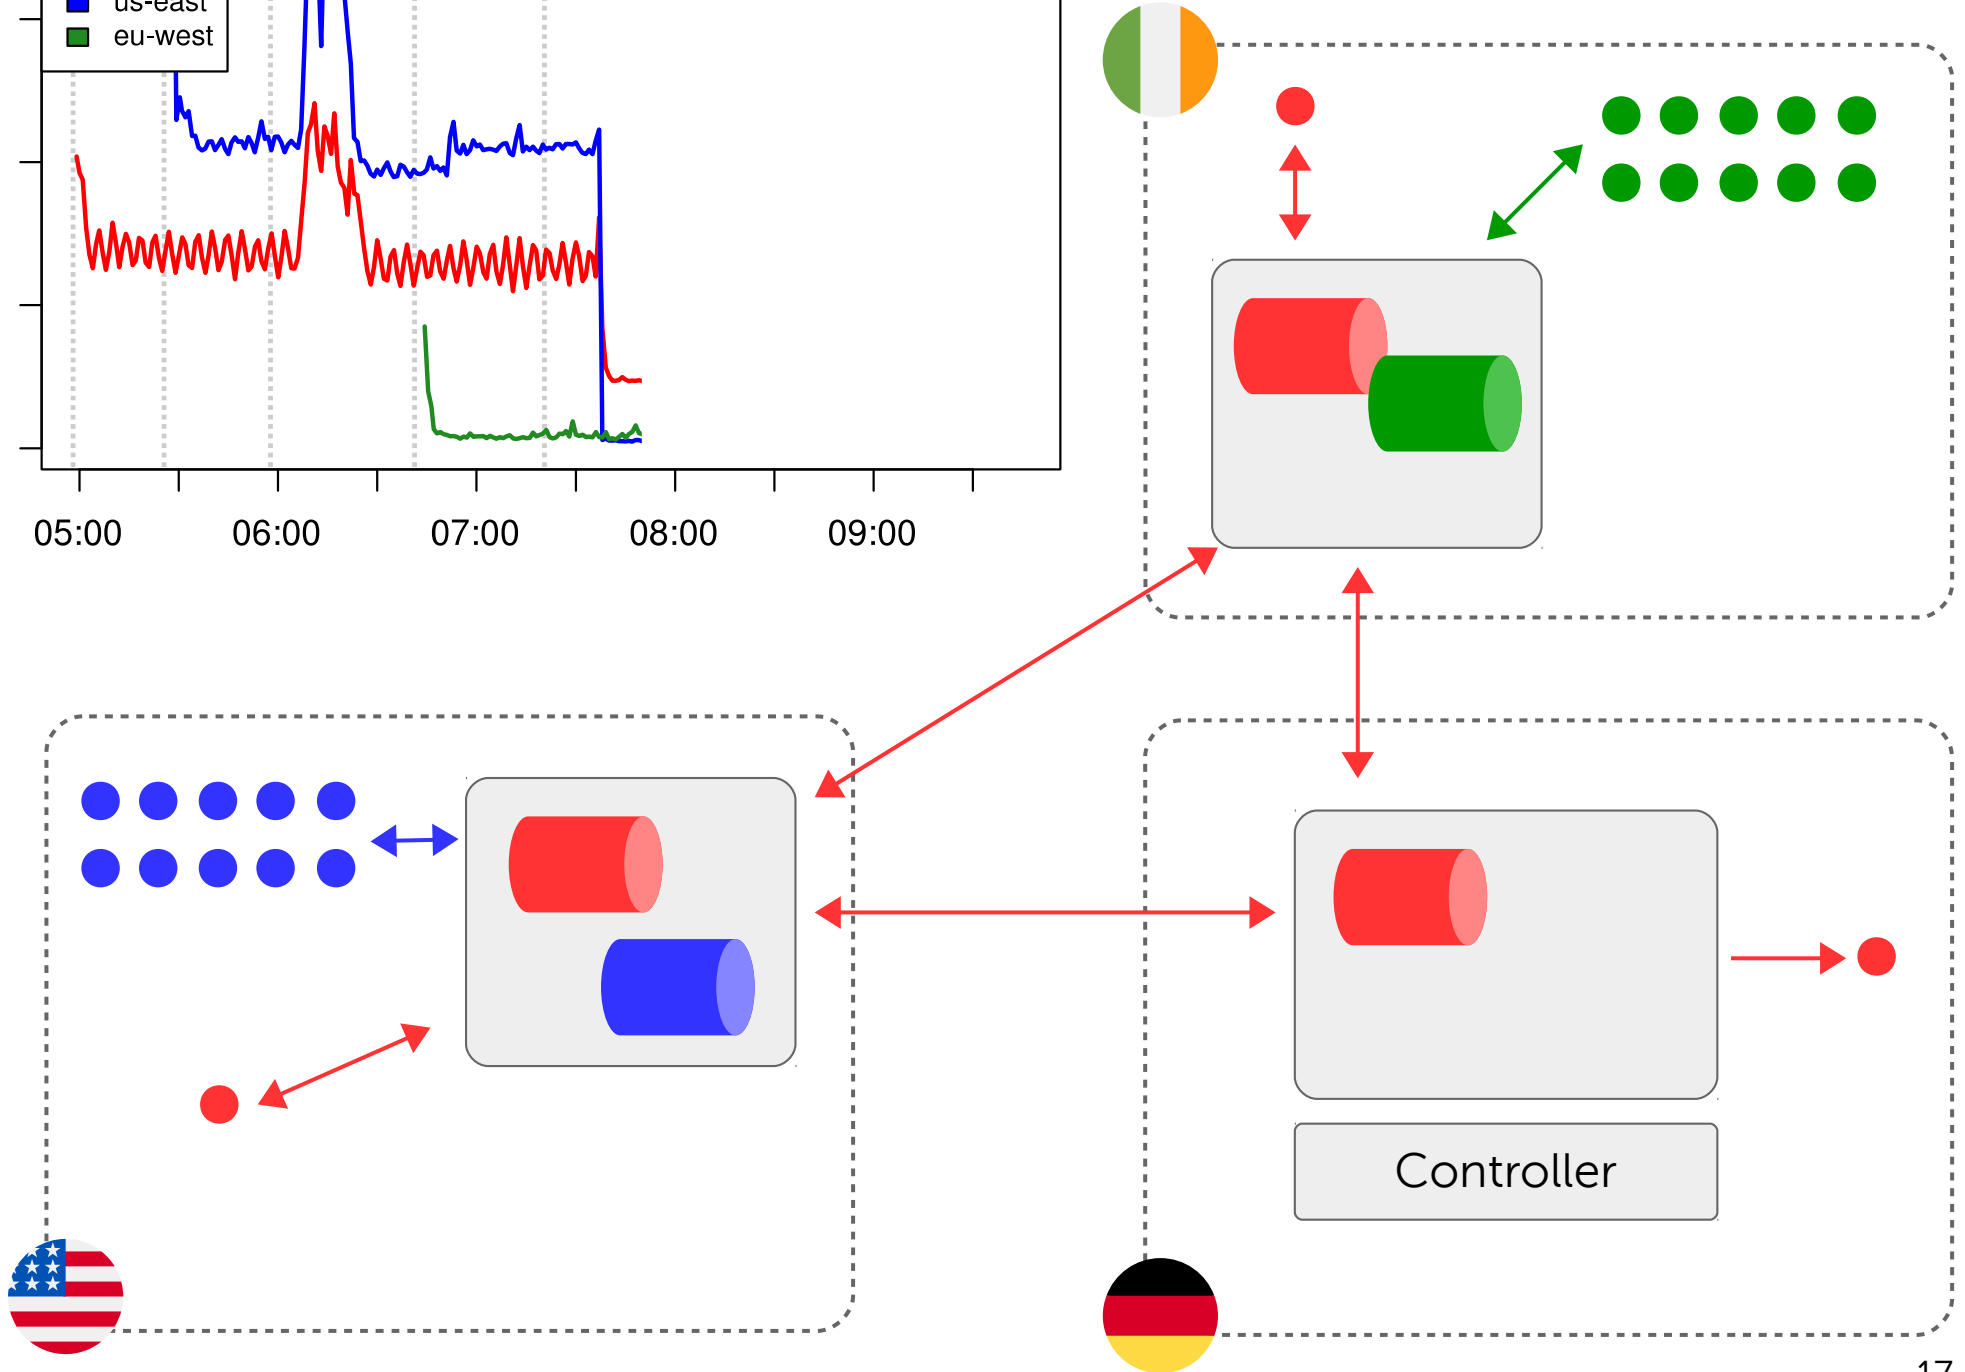

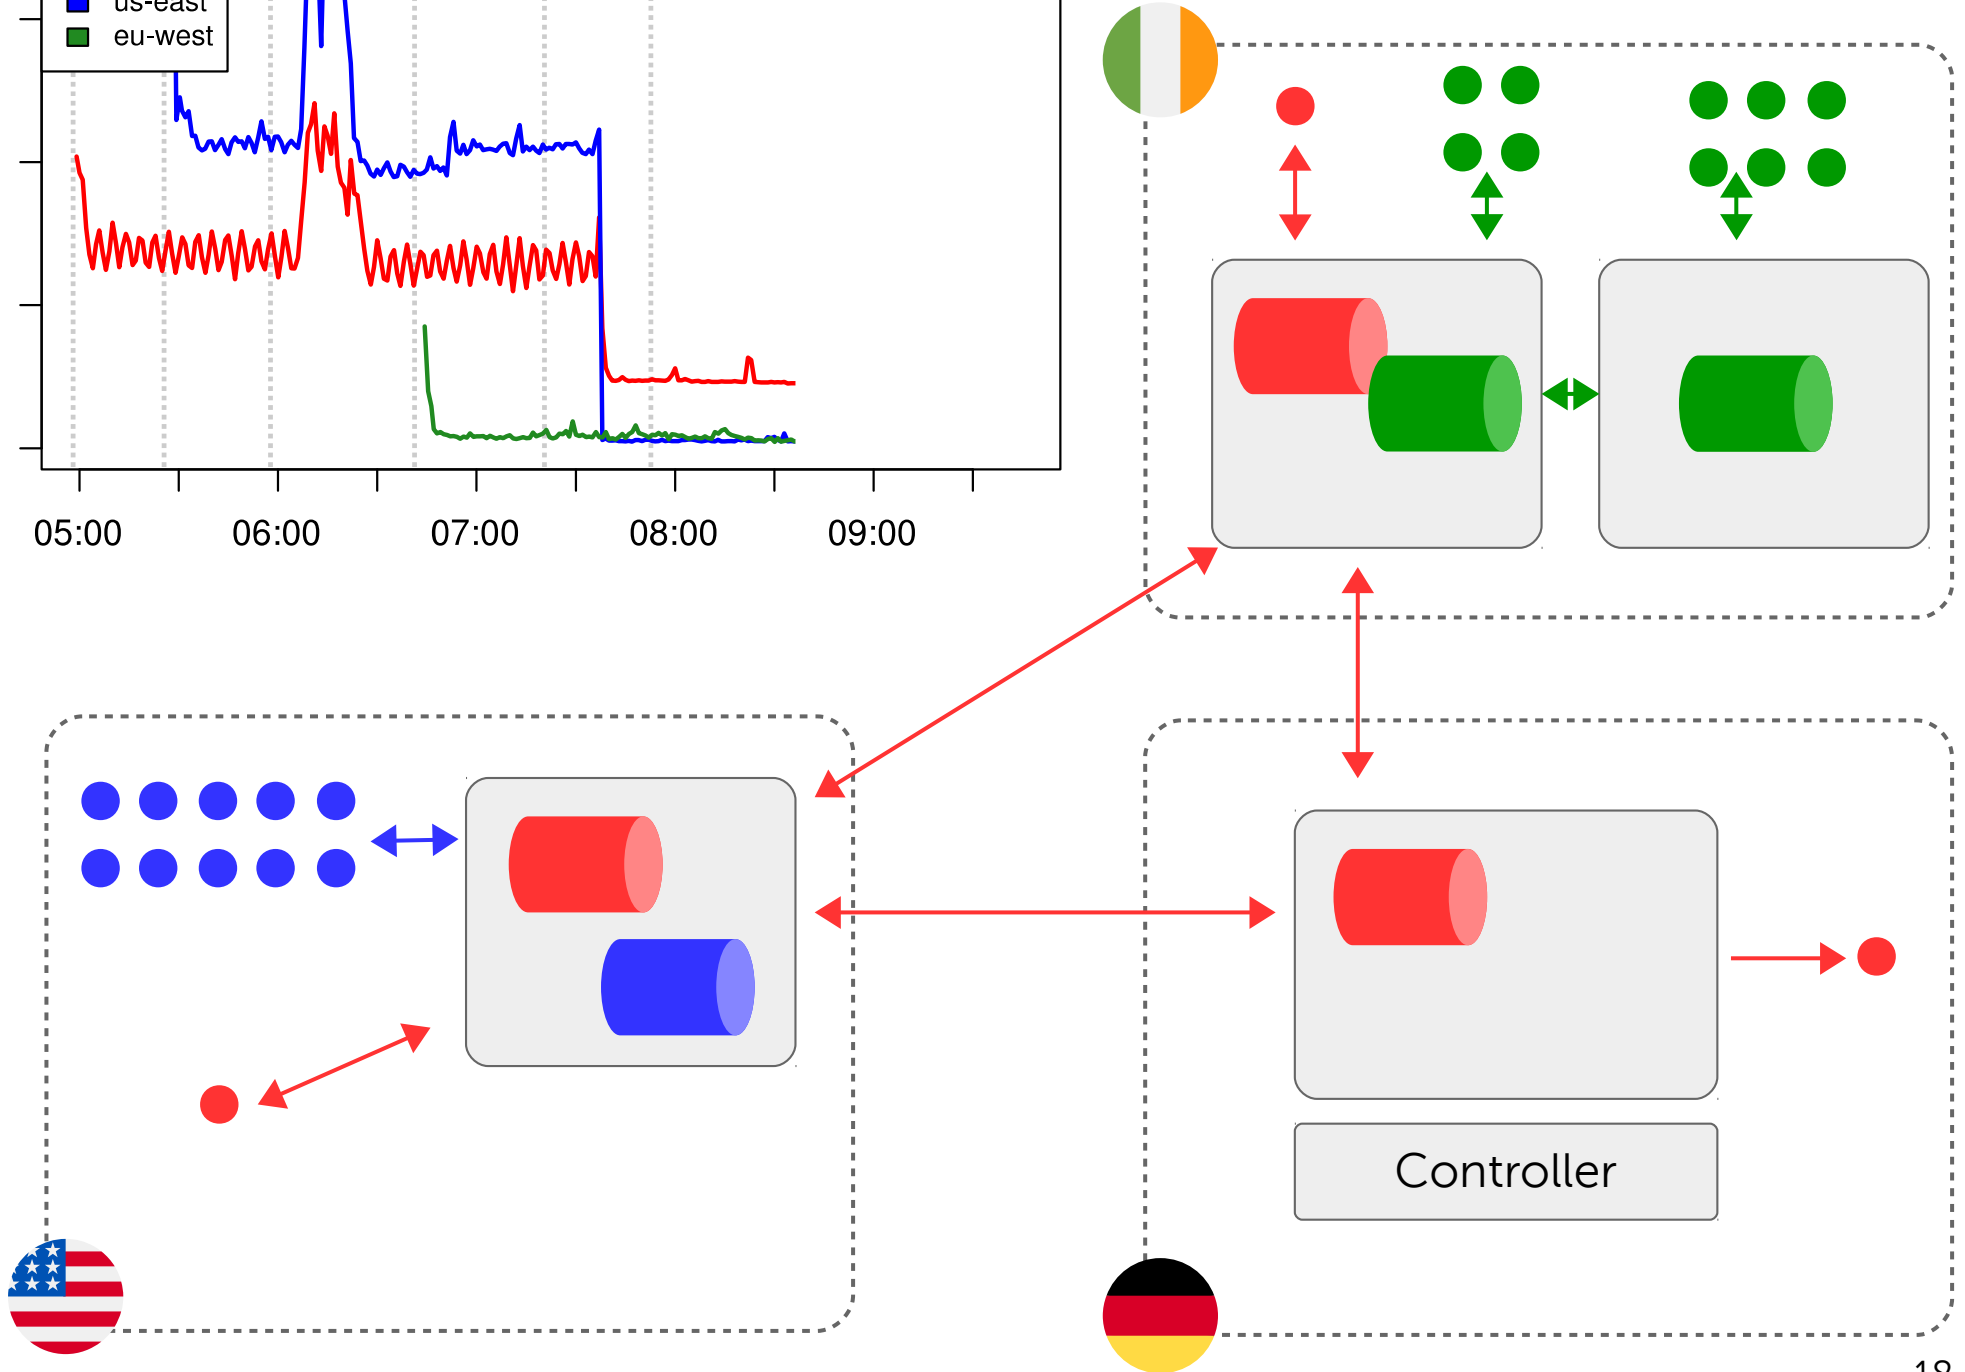

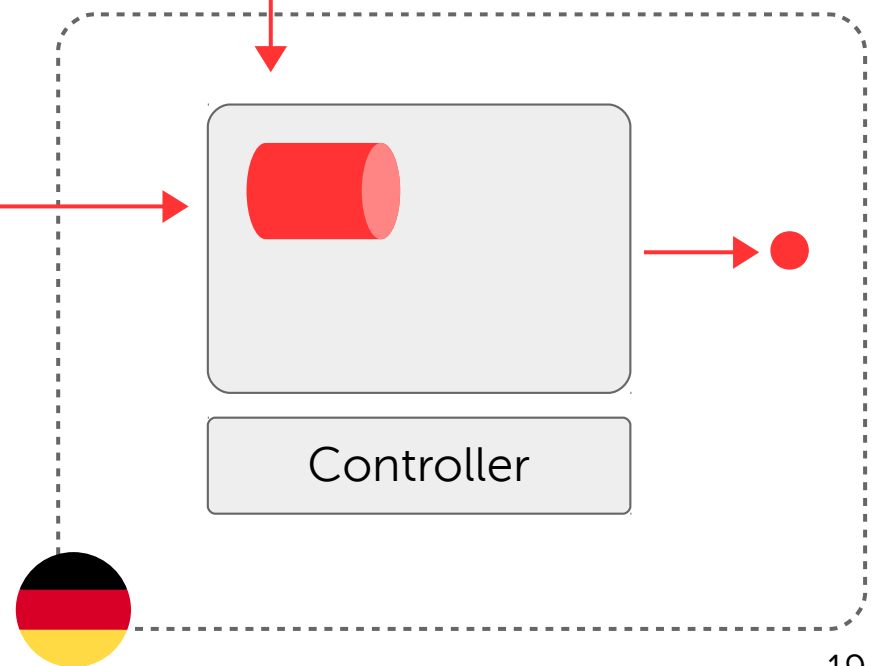

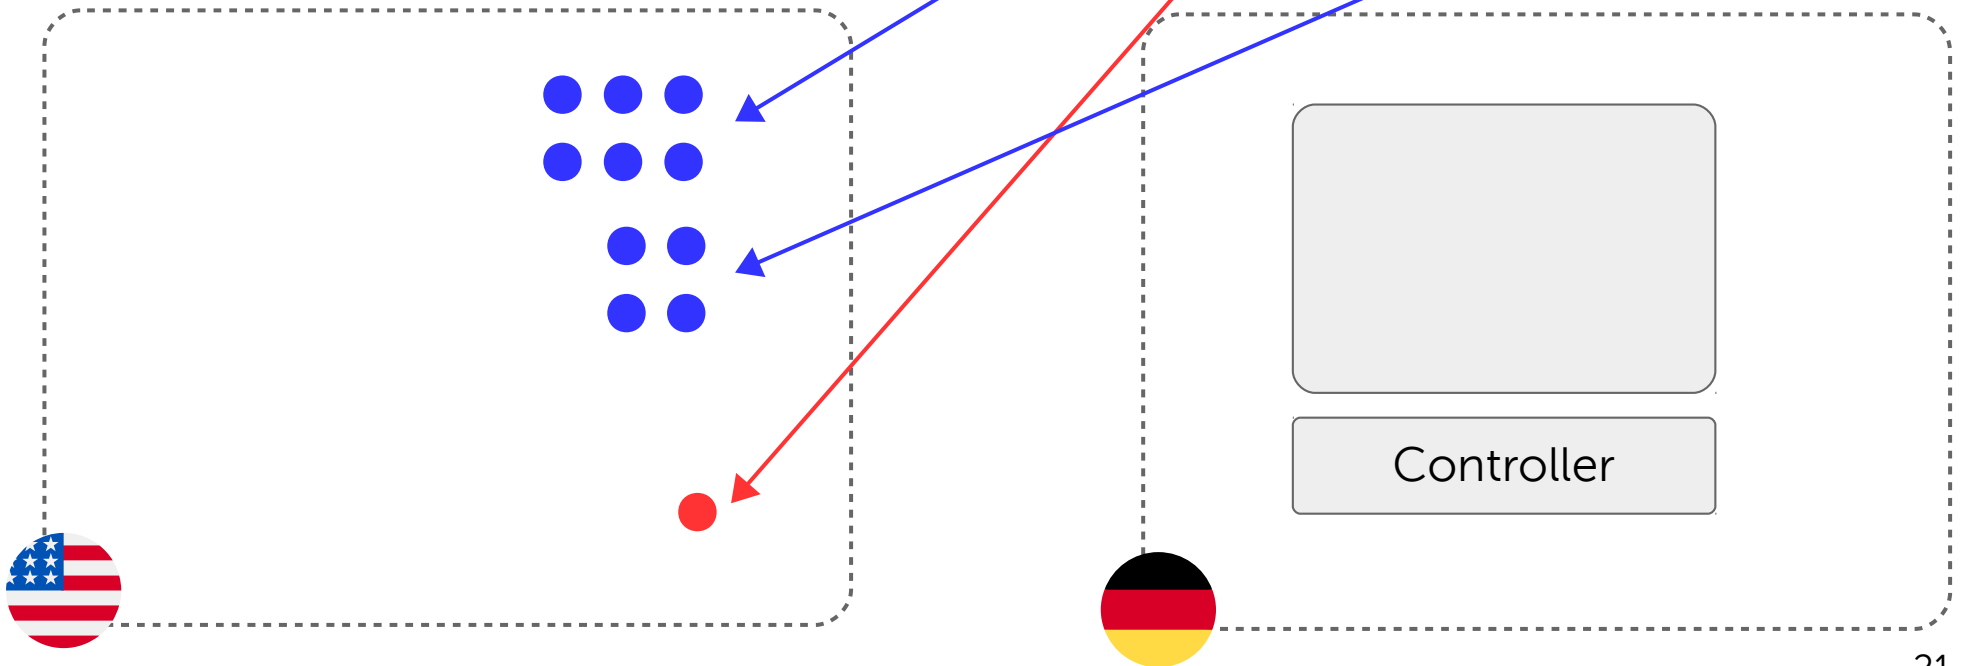

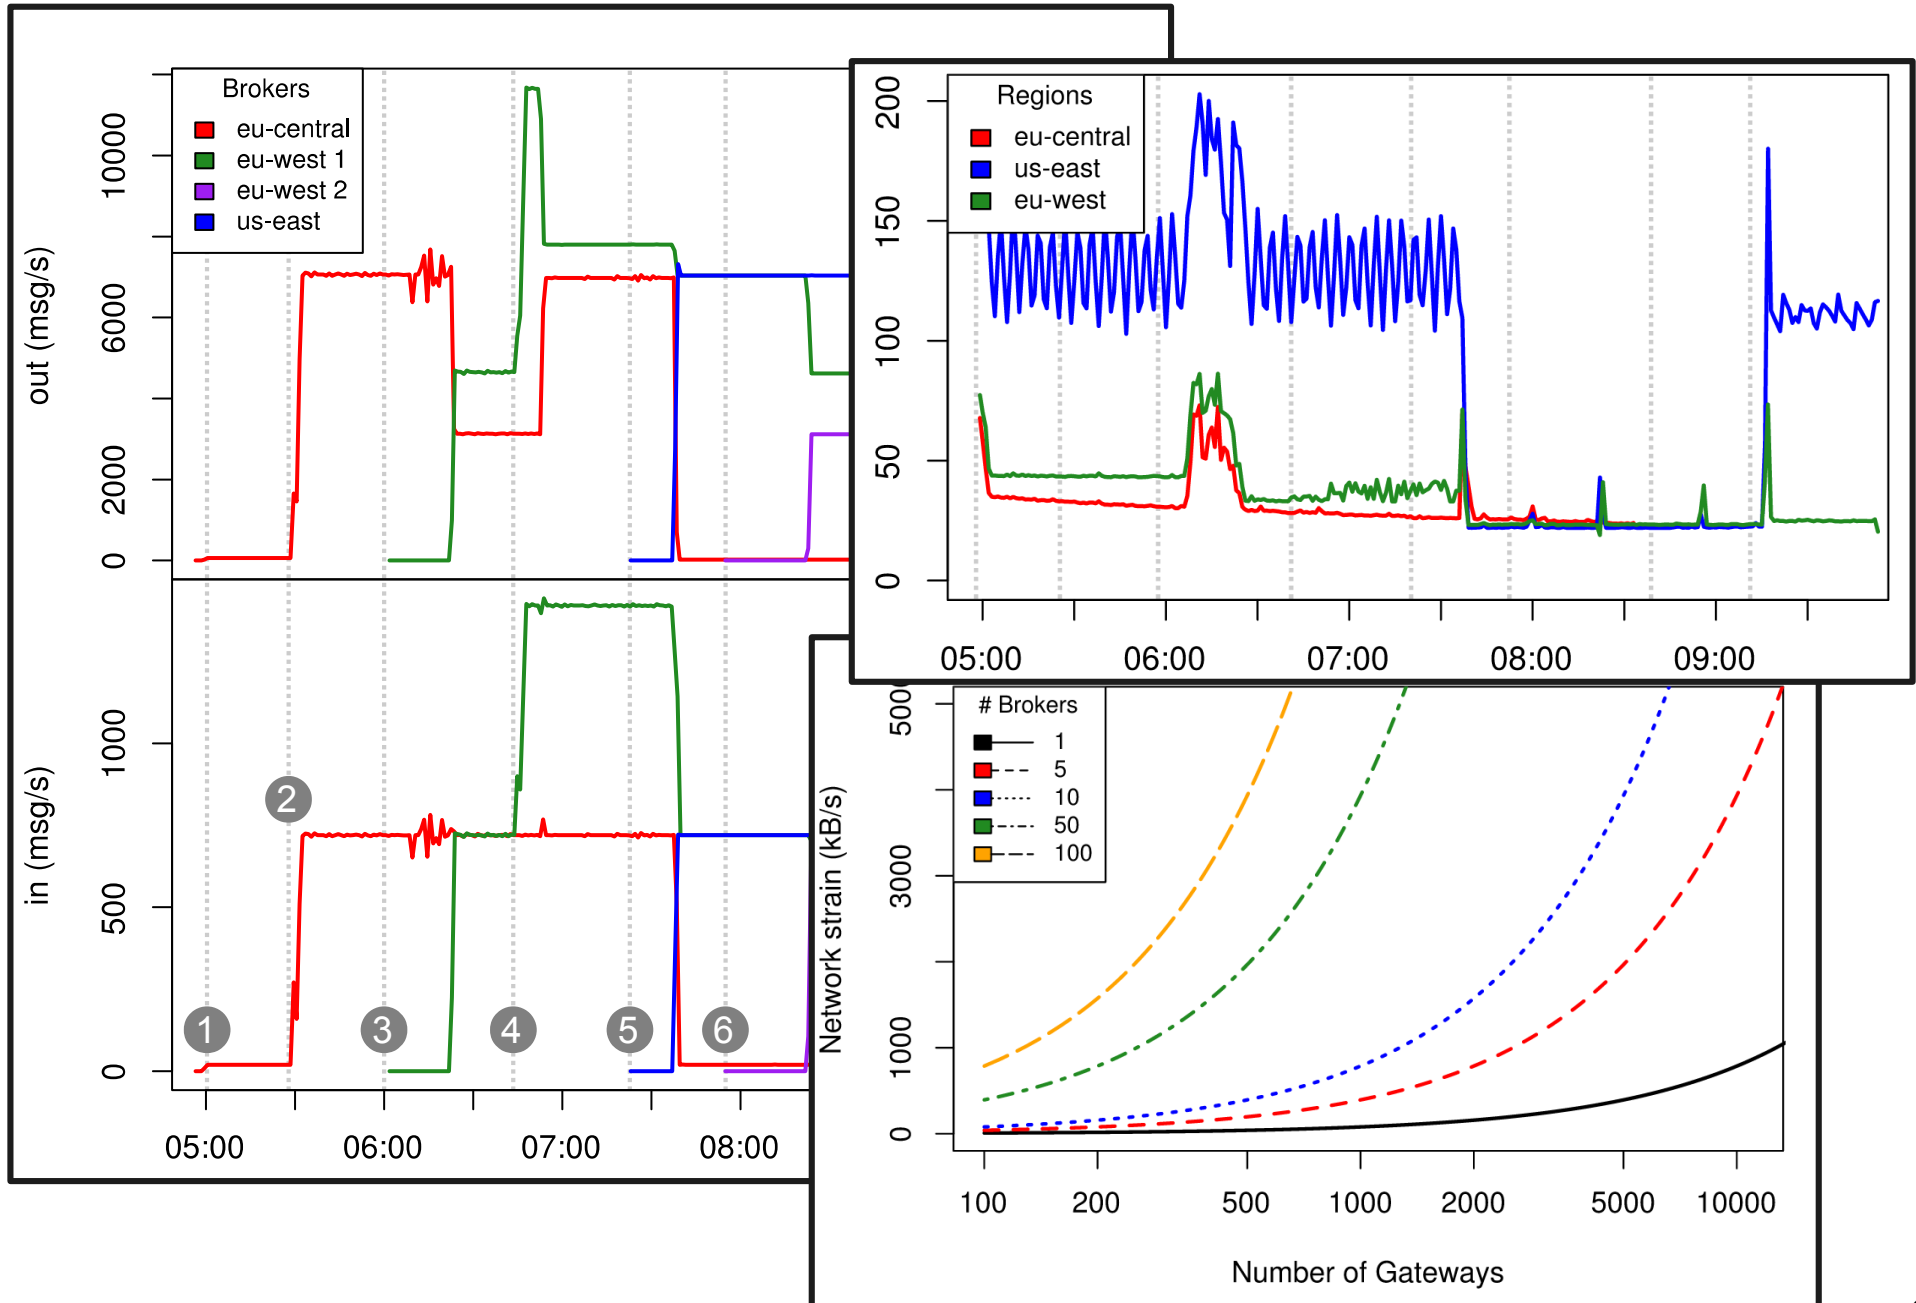

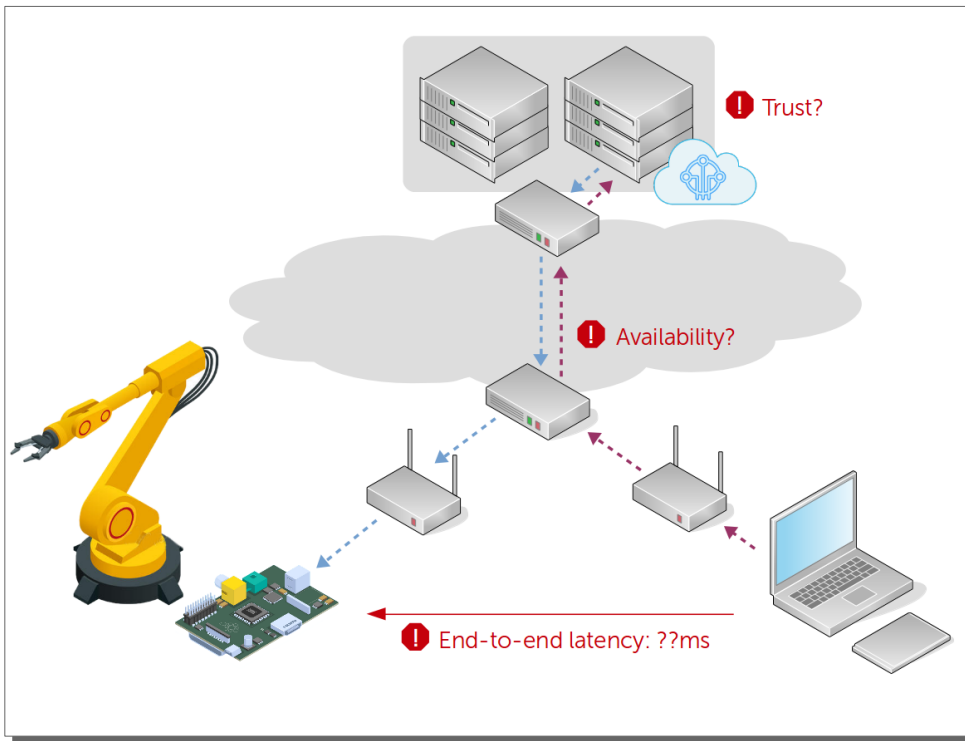

Message Loss

- Caused by subscriber mobility
- Guaranteed message delivery requires transactional reconnection

ABSTRACT

Distributed content-based publish/subscribe systems provide a selective, scalable, and decentralized approach to data dissemination. In a pub/sub overlay network, hop-by-hop routing allows brokers to correctly forward messages without requiring global knowledge. However, this model causes brokers to forward publications without

24]. Clients can subscribe to fine grained data using content-based subscriptions and receive notifications whenever matching publications are disseminated by publishers. In a distributed pub/sub system, the task of matching and forwarding messages to all interested clients are divided and allocated to a network of brokers, collectively called the pub/sub overlay network. In many systems,
